CONTENTS IN BRIEF

List of business snapshots	15
List of technical notes	16
Preface	17
1. Introduction	23
2. Futures markets and central counterparties	46
3. Hedging strategies using futures	70
4. Interest rates	98
5. Determination of forward and futures prices	124
6. Interest rate futures	152
7. Swaps	172
8. Securitization and the financial crisis of 2007–8	201
9. XVAs	216
10. Mechanics of options markets	227
11. Properties of stock options	247
12. Trading strategies involving options	268
13. Binomial trees	288
14. Wiener processes and Itô's lemma	316
15. The Black–Scholes–Merton model	338
16. Employee stock options	371
17. Options on stock indices and currencies	384
18. Futures options and Black's model	401
19. The Greek letters	417
20. Volatility smiles and volatility surfaces	451
21. Basic numerical procedures	470
22. Value at risk and expected shortfall	514
23. Estimating volatilities and correlations	542
24. Credit risk	562
25. Credit derivatives	587
26. Exotic options	614
27. More on models and numerical procedures	640
28. Martingales and measures	670
29. Interest rate derivatives: The standard market models	688
30. Convexity, timing, and quanto adjustments	707
31. Equilibrium models of the short rate	719
32. No-arbitrage models of the short rate	732
33. Modeling forward rates	755
34. Swaps revisited	773
35. Energy and commodity derivatives	785
36. Real options	802
37. Derivatives mishaps and what we can learn from them	815
Glossary of terms	827
DerivaGem software	851
Exchanges trading futures and options	856
Table for $N(x)$ When $x \leq 0$	857

Subject index	863

CONTENTS

List of business snapshots	15
List of technical notes	16
Preface	17
Chapter 1. Introduction	23
1.1 Exchange-traded markets	24
1.2 Over-the-counter markets	25
1.3 Forward contracts	28
1.4 Futures contracts	30
1.5 Options	31
1.6 Types of traders	33
1.7 Hedgers	34
1.8 Speculators	36
1.9 Arbitrageurs	39
1.10 Dangers	39
Summary	41
Further reading	41
Practice questions	42
Chapter 2. Futures markets and central counterparties	46
2.1 Background	46
2.2 Specification of a futures contract	48
2.3 Convergence of futures price to spot price	50
2.4 The operation of margin accounts	51
2.5 OTC markets	54
2.6 Market quotes	57
2.7 Delivery	60
2.8 Types of traders and types of orders	61
2.9 Regulation	62
2.10 Accounting and tax	63
2.11 Forward vs. futures contracts	64
Summary	65
Further reading	66
Practice questions	67
Chapter 3. Hedging strategies using futures	70
3.1 Basic principles	70
3.2 Arguments for and against hedging	72
3.3 Basis risk	75
3.4 Cross hedging	79
3.5 Stock index futures	84
3.6 Stack and roll	89
Summary	90

	Further reading	92
	Practice questions	93
	Appendix: Capital asset pricing model	96
Chapter 4.	Interest rates	98
4.1	Types of rates	98
4.2	Reference rates	99
4.3	The risk-free rate	101
4.4	Measuring interest rates	101
4.5	Zero rates	104
4.6	Bond pricing	105
4.7	Determining zero rates	106
4.8	Forward rates	109
4.9	Forward rate agreements	110
4.10	Duration	112
4.11	Convexity	116
4.12	Theories of the term structure of interest rates	117
	Summary	119
	Further reading	120
	Practice questions	121
Chapter 5.	Determination of forward and futures prices	124
5.1	Investment assets vs. consumption assets	124
5.2	Short selling	125
5.3	Assumptions and notation	126
5.4	Forward price for an investment asset	127
5.5	Known income	130
5.6	Known yield	132
5.7	Valuing forward contracts	133
5.8	Are forward prices and futures prices equal?	135
5.9	Futures prices of stock indices	135
5.10	Forward and futures contracts on currencies	137
5.11	Futures on commodities	141
5.12	The cost of carry	143
5.13	Delivery options	144
5.14	Futures prices and expected future spot prices	144
	Summary	147
	Further reading	148
	Practice questions	149
Chapter 6.	Interest rate futures	152
6.1	Day count and quotation conventions	152
6.2	Treasury bond futures	155
6.3	Eurodollar and SOFR futures	160
6.4	Duration-based hedging strategies using futures	165
6.5	Hedging portfolios of assets and liabilities	167
	Summary	168
	Further reading	168
	Practice questions	169
Chapter 7.	Swaps	172
7.1	Mechanics of interest rate swaps	172
7.2	Determining risk-free rates	175

7.3	Reasons for trading interest rate swaps	176
7.4	The organization of trading	178
7.5	The comparative-advantage argument	181
7.6	Valuation of interest rate swaps	183
7.7	How the value changes through time	185
7.8	Fixed-for-fixed currency swaps	186
7.9	Valuation of fixed-for-fixed currency swaps	190
7.10	Other currency swaps	192
7.11	Credit risk	193
7.12	Credit default swaps	193
7.13	Other types of swaps	194
	Summary	196
	Further reading	196
	Practice questions	197
Chapter 8.	Securitization and the financial crisis of 2007–8	201
8.1	Securitization	201
8.2	The U.S. housing market	205
8.3	What went wrong?	209
8.4	The aftermath	211
	Summary	213
	Further reading	213
	Practice questions	215
Chapter 9.	XVAs	216
9.1	CVA and DVA	216
9.2	FVA and MVA	219
9.3	KVA	222
9.4	Calculation issues	223
	Summary	224
	Further reading	225
	Practice questions	226
Chapter 10.	Mechanics of options markets	227
10.1	Types of options	227
10.2	Option positions	229
10.3	Underlying assets	231
10.4	Specification of stock options	233
10.5	Trading	236
10.6	Trading costs	237
10.7	Margin requirements	237
10.8	The options clearing corporation	239
10.9	Regulation	239
10.10	Taxation	240
10.11	Warrants, employee stock options, and convertibles	241
10.12	Over-the-counter options markets	242
	Summary	243
	Further reading	243
	Practice questions	244
Chapter 11.	Properties of stock options	247
11.1	Factors affecting option prices	247
11.2	Assumptions and notation	251

11.3	Upper and lower bounds for option prices	252
11.4	Put–call parity	255
11.5	Calls on a non-dividend-paying stock	257
11.6	Puts on a non-dividend-paying stock	260
11.7	Effect of dividends	262
	Summary	263
	Further reading	264
	Practice questions	265
Chapter 12.	Trading strategies involving options	268
12.1	Principal-protected notes	268
12.2	Trading an option and the underlying asset	270
12.3	Spreads	272
12.4	Combinations	280
12.5	Other payoffs	283
	Summary	284
	Further reading	285
	Practice questions	285
Chapter 13.	Binomial trees	288
13.1	A one-step binomial model and a no-arbitrage argument	288
13.2	Risk-neutral valuation	292
13.3	Two-step binomial trees	294
13.4	A put example	297
13.5	American options	298
13.6	Delta	299
13.7	Matching volatility with u and d	300
13.8	The binomial tree formulas	302
13.9	Increasing the number of steps	302
13.10	Using DerivaGem	303
13.11	Options on other assets	304
	Summary	308
	Further reading	308
	Practice questions	309
	Appendix: Derivation of the Black–Scholes–Merton option-pricing formula from a binomial tree	312
Chapter 14.	Wiener processes and Itô’s lemma	316
14.1	The Markov property	316
14.2	Continuous-time stochastic processes	317
14.3	The process for a stock price	322
14.4	The parameters	325
14.5	Correlated processes	326
14.6	Itô’s lemma	327
14.7	The lognormal property	328
14.8	Fractional Brownian motion	329
	Summary	330
	Further reading	332
	Practice questions	333
	Appendix: A nonrigorous derivation of Itô’s lemma	336
Chapter 15.	The Black–Scholes–Merton model	338
15.1	Lognormal property of stock prices	339
15.2	The distribution of the rate of return	340

15.3	The expected return	341
15.4	Volatility	342
15.5	The idea underlying the Black–Scholes–Merton differential equation	346
15.6	Derivation of the Black–Scholes–Merton differential equation	348
15.7	Risk-neutral valuation	351
15.8	Black–Scholes–Merton pricing formulas	352
15.9	Cumulative normal distribution function	355
15.10	Warrants and employee stock options	356
15.11	Implied volatilities	358
15.12	Dividends	360
	Summary	363
	Further reading	364
	Practice questions	365
	Appendix: Proof of the Black–Scholes–Merton formula using risk-neutral valuation	369
Chapter 16.	Employee stock options	371
16.1	Contractual arrangements	371
16.2	Do options align the interests of shareholders and managers?	373
16.3	Accounting issues	374
16.4	Valuation	375
16.5	The backdating scandal	380
	Summary	381
	Further reading	381
	Practice questions	382
Chapter 17.	Options on stock indices and currencies	384
17.1	Options on stock indices	384
17.2	Currency options	386
17.3	Options on stocks paying known dividend yields	389
17.4	Valuation of European stock index options	391
17.5	Valuation of European currency options	394
17.6	American options	395
	Summary	396
	Further reading	397
	Practice questions	397
Chapter 18.	Futures options and Black’s model	401
18.1	Nature of futures options	401
18.2	Reasons for the popularity of futures options	404
18.3	European spot and futures options	404
18.4	Put–call parity	405
18.5	Bounds for futures options	406
18.6	Drift of a futures price in a risk-neutral world	407
18.7	Black’s model for valuing futures options	408
18.8	Using Black’s model instead of Black–Scholes–Merton	409
18.9	Valuation of futures options using binomial trees	410
18.10	American futures options vs. American spot options	412
18.11	Futures-style options	413
	Summary	413
	Further reading	414
	Practice questions	414

Chapter 19. The Greek letters	417
19.1 Illustration	417
19.2 Naked and covered positions	418
19.3 Greek letter calculation	420
19.4 Delta hedging	421
19.5 Theta	427
19.6 Gamma	429
19.7 Relationship between delta, theta, and gamma	433
19.8 Vega	434
19.9 Rho	436
19.10 The realities of hedging	437
19.11 Scenario analysis	437
19.12 Extension of formulas	439
19.13 Portfolio insurance	441
19.14 Application of machine learning to hedging	443
Summary	444
Further reading	445
Practice questions	446
Appendix: Taylor series expansions and Greek letters	450
Chapter 20. Volatility smiles and volatility surfaces	451
20.1 Implied volatilities of calls and puts	451
20.2 Volatility smile for foreign currency options	453
20.3 Volatility smile for equity options	456
20.4 Alternative ways of characterizing the volatility smile	458
20.5 The volatility term structure and volatility surfaces	458
20.6 Minimum variance delta	460
20.7 The role of the model	460
20.8 When a single large jump is anticipated	460
Summary	462
Further reading	463
Practice questions	464
Appendix: Determining implied risk-neutral distributions from volatility smiles	467
Chapter 21. Basic numerical procedures	470
21.1 Binomial trees	470
21.2 Using the binomial tree for options on indices, currencies, and futures contracts	478
21.3 Binomial model for a dividend-paying stock	480
21.4 Alternative procedures for constructing trees	485
21.5 Time-dependent parameters	488
21.6 Monte Carlo simulation	489
21.7 Variance reduction procedures	495
21.8 Finite difference methods	498
Summary	508
Further reading	509
Practice questions	510
Chapter 22. Value at risk and expected shortfall	514
22.1 The VaR and ES measures	514
22.2 Historical simulation	517

22.3	Model-building approach	521
22.4	The linear model	524
22.5	The quadratic model	530
22.6	Monte Carlo simulation	533
22.7	Comparison of approaches	533
22.8	Back testing	534
22.9	Principal components analysis	534
	Summary	537
	Further reading	538
	Practice questions	539
Chapter 23.	Estimating volatilities and correlations	542
23.1	Estimating volatility	542
23.2	The exponentially weighted moving average model	544
23.3	The GARCH(1,1) model	546
23.4	Choosing between the models	547
23.5	Maximum likelihood methods	548
23.6	Using GARCH(1,1) to forecast future volatility	553
23.7	Correlations	556
	Summary	558
	Further reading	559
	Practice questions	559
Chapter 24.	Credit risk	562
24.1	Credit ratings	562
24.2	Historical default probabilities	563
24.3	Recovery rates	564
24.4	Estimating default probabilities from bond yield spreads	564
24.5	Comparison of default probability estimates	567
24.6	Using equity prices to estimate default probabilities	570
24.7	Credit risk in derivatives transactions	571
24.8	Default correlation	577
24.9	Credit VaR	580
	Summary	582
	Further reading	583
	Practice questions	583
Chapter 25.	Credit derivatives	587
25.1	Credit default swaps	588
25.2	Valuation of credit default swaps	591
25.3	Credit indices	595
25.4	The use of fixed coupons	596
25.5	CDS forwards and options	597
25.6	Basket credit default swaps	597
25.7	Total return swaps	597
25.8	Collateralized debt obligations	599
25.9	Role of correlation in a basket CDS and CDO	601
25.10	Valuation of a synthetic CDO	601
25.11	Alternatives to the standard market model	608
	Summary	610
	Further reading	610
	Practice questions	611

Chapter 26. Exotic options	614
26.1 Packages	614
26.2 Perpetual American call and put options	615
26.3 Nonstandard American options	616
26.4 Gap options	617
26.5 Forward start options	618
26.6 Cliquet options	618
26.7 Compound options	618
26.8 Chooser options	619
26.9 Barrier options	620
26.10 Binary options	622
26.11 Lookback options	623
26.12 Shout options	625
26.13 Asian options	626
26.14 Options to exchange one asset for another	627
26.15 Options involving several assets	628
26.16 Volatility and variance swaps	629
26.17 Static options replication	632
Summary	634
Further reading	635
Practice questions	635
Chapter 27. More on models and numerical procedures	640
27.1 Alternatives to Black–Scholes–Merton	641
27.2 Stochastic volatility models	646
27.3 The IVF model	649
27.4 Convertible bonds	650
27.5 Path-dependent derivatives	653
27.6 Barrier options	656
27.7 Options on two correlated assets	658
27.8 Monte Carlo simulation and American options	660
Summary	665
Further reading	666
Practice questions	667
Chapter 28. Martingales and measures	670
28.1 The market price of risk	671
28.2 Several state variables	674
28.3 Martingales	675
28.4 Alternative choices for the numeraire	676
28.5 Extension to several factors	679
28.6 Black’s model revisited	680
28.7 Option to exchange one asset for another	681
28.8 Change of numeraire	682
Summary	684
Further reading	685
Practice questions	685
Chapter 29. Interest rate derivatives: The standard market models	688
29.1 Bond options	688
29.2 Interest rate caps and floors	693
29.3 European swap options	699
29.4 Hedging interest rate derivatives	703

Summary	703
Further reading	704
Practice questions	704
Chapter 30. Convexity, timing, and quanto adjustments	707
30.1 Convexity adjustments	707
30.2 Timing adjustments	710
30.3 Quantos	711
Summary	714
Further reading	715
Practice questions	715
Appendix: Proof of the convexity adjustment formula	718
Chapter 31. Equilibrium models of the short rate	719
31.1 Background	719
31.2 One-factor models	721
31.3 Real-world vs. risk-neutral processes	726
31.4 Estimating parameters	727
31.5 More sophisticated models	728
Summary	729
Further reading	729
Practice questions	729
Chapter 32. No-arbitrage models of the short rate	732
32.1 Extensions of equilibrium models	732
32.2 Options on bonds	736
32.3 Volatility structures	737
32.4 Interest rate trees	738
32.5 A general tree-building procedure	740
32.6 Calibration	749
32.7 Hedging using a one-factor model	751
Summary	752
Further reading	752
Practice questions	752
Chapter 33. Modeling forward rates	755
33.1 The Heath, Jarrow, and Morton model	755
33.2 The BGM model	758
33.3 Agency mortgage-backed securities	768
Summary	770
Further reading	770
Practice questions	771
Chapter 34. Swaps revisited	773
34.1 Variations on the vanilla deal	773
34.2 Compounding swaps	775
34.3 Currency and nonstandard swaps	776
34.4 Equity swaps	777
34.5 Swaps with embedded options	779
34.6 Other swaps	781
Summary	782
Further reading	783
Practice questions	783

Chapter 35. Energy and commodity derivatives	785
35.1 Agricultural commodities	785
35.2 Metals	786
35.3 Energy products	787
35.4 Modeling commodity prices	789
35.5 Weather derivatives	795
35.6 Insurance derivatives	796
35.7 Pricing weather and insurance derivatives	797
35.8 How an energy producer can hedge risks	798
Summary	799
Further reading	799
Practice questions	800
Chapter 36. Real options	802
36.1 Capital investment appraisal	802
36.2 Extension of the risk-neutral valuation framework	803
36.3 Estimating the market price of risk	805
36.4 Application to the valuation of a business	806
36.5 Evaluating options in an investment opportunity	806
Summary	813
Further reading	813
Practice questions	814
Chapter 37. Derivatives mishaps and what we can learn from them	815
37.1 Lessons for all users of derivatives	815
37.2 Lessons for financial institutions	819
37.3 Lessons for nonfinancial corporations	824
Summary	826
Further reading	826
Glossary of terms	827
DerivaGem software	851
Exchanges trading futures and options	856
Table for $N(x)$ When $x \leq 0$	857
Author index	859
Subject index	863

BUSINESS SNAPSHOTS

1.1	The Lehman Bankruptcy	26

30. The Return of a Security Dependent on Multiple Sources of Uncertainty
31. Properties of Ho–Lee and Hull–White Interest Rate Models

PREFACE

Derivatives markets have seen many changes over the last 30 years. Successive editions of *Options, Futures, and Other Derivatives* have managed to keep up to date. The book has an applied approach. It is a very popular college text, but it can also be found on trading-room desks throughout the world. (Indeed, I receive emails from derivatives practitioners about the book almost every day.) The blending of material useful for practitioners with material appropriate for university courses is what makes the book unique.

NEW TO THIS EDITION

- A major change in financial markets will be the phase-out of LIBOR. This has led to important changes throughout the 11th edition. The overnight reference rates that will replace LIBOR, and the way they are used to determine zero curves, are discussed carefully.
- Within-chapter examples and end-of-chapter problems that were previously based on LIBOR have been largely replaced by examples based on the new reference rates or by generic examples.
- The likely impact of the new reference rates on valuation models is discussed.
- The new reference rates are considered to be risk-free whereas LIBOR incorporates a time-varying credit spread. The book discusses the desire on the part of banks to augment the new reference rates with a measure of the level of credit spreads in the market.
- The chapter on Wiener processes now covers fractional Brownian motion. This is becoming increasingly used in modeling volatility.
- Rough volatility models which have in the last few years been found to fit volatility surfaces well are added to the models considered in Chapter 27.
- Machine learning is becoming increasingly used in pricing and hedging derivatives. The reader is introduced to these applications at various points in the book.
- Changes in the regulatory environment, including Basel IV, are covered.
- The end-of-chapter problems have been updated. To make the book as easy to use as possible, solutions to all end-of-chapter problems are now on www.pearsonglobaleditions.com and www-2.rotman.utoronto.ca/~hull.

- Instructor support material has been revised. In particular, there are now many more suggestions on assignment questions that can be used in conjunction with chapters.
- The DerivaGem software is less LIBOR-focused and is available for download from www-2.rotman.utoronto.ca/~hull/software.
- Tables, charts, market data, and examples have been updated throughout the book.

SOLVING TEACHING AND LEARNING CHALLENGES

Most instructors find that courses in derivatives are fun to teach. There is not a big gap between theory and practice. Most students know a little about the subject and are motivated to learn more. Usually there is some current news that can be discussed in class, e.g., the level of the VIX index or events that affect particular option prices.

Math Knowledge

Math is the key challenge for many students taking a course in derivatives. I have kept this in mind in the way material is presented throughout the book. Instructors are often faced with a trade-off between mathematical rigor and the simplicity with which an idea is explained. My preference is always to look for the simplest way of explaining an idea in the first instance. Sometimes using words rather than equations is effective. I avoid using notation that has lots of subscripts, superscripts, and function arguments as far as possible because this can be off-putting to a reader who is new to the material. Nonessential mathematical material has been either eliminated or included in technical notes on my website.

The reality is that many students only understand an equation when they have seen numbers substituted into it. For that reason, many numerical examples have been included in the text. The software DerivaGem (discussed below) allows students to get a feel for equations by trying different inputs.

I am often asked about the math prerequisites for *Options, Futures and Other Derivatives*. Students will be able to cope with a course based on this book if they are comfortable with algebra and understand probabilities and probability distributions. A knowledge of calculus concepts is useful for parts of the book. But no knowledge of stochastic calculus is assumed. The basic knowledge of stochastic processes that is needed for a more advanced understanding of derivatives is explained carefully in Chapter 14.

End of Chapter Problems

As in earlier editions, there are many other end-of-chapter problems to help students apply the ideas presented in the chapters. These have been updated. The distinction between “practice questions” and “further questions” has been eliminated. Answers to all end-of-chapter problems are on my website and available through www.pearsonglobaleditions.com.

Designing a Course

There are many ways in which the material in the book can be used. Instructors teaching an introductory course in derivatives tend to spend most time on the first 20 chapters, and often choose to omit Chapter 14 and Section 15.6. Instructors teaching a more advanced course find that many different combinations of chapters in the second half of the book can be used. I find that Chapter 37 is a fun chapter that works well at the end of either an introductory or an advanced course.

Software

The DerivaGem software is an important part of the book. Students get comfortable with the models presented in the book when they use DerivaGem to value transactions under different assumptions. The use of the software is explained at the end of the book.

I recommend giving students assignments that involve using the basic DG400a.xls software. There are many types of assignments that can be developed. For example, students can be asked to compare American or European option prices given by a binomial model with those from the Black–Scholes–Merton model. They can be asked to report what happens as the number of time steps is increased in a binomial model and can use the software to display trees. (DerivaGem can display trees with up to 10 time steps and can calculate prices and Greek letters using up to 500 time steps.)

Many charts can be produced using the software and students can include those charts in reports produced for the instructor. The calculation of zero curves and swap valuation is made easy with DerivaGem. I like to use DerivaGem in class when I illustrate some key concepts.

Students taking a more advanced course in derivatives can be asked to compare prices given by different models using the *Alternative Models* worksheet in DG400a.xls. Alternatives to Black–Scholes that are covered include CEV, Merton mixed jump–diffusion, variance gamma, Heston, and SABR. Students can also be asked to carry out assignments concerned with the use of different models for pricing bond options. The CDS and CDO worksheets can be used in conjunction with each other for an assignment if CDOs are covered.

DerivaGem can be used in conjunction with current market data that can be downloaded from Yahoo Finance or other providers. For example, students can be asked to compare implied volatilities for options on different stocks that have been in the news. They can also be asked to calculate volatility term structures and volatility smiles for stock indices. Assignments such as these can be important because they make the underlying concepts more “real” and lead to interesting classroom discussions.

The *DG400 Applications* software enables students to carry out assignments where they are asked investigate issues such as how the performance of delta hedging is improved as the interval between rebalancing is decreased or how managing gamma can improve the performance of delta hedging. Assuming students have a basic knowledge of Excel, they should have no difficulty using this software and changing instructions as necessary.

The *DG400 Functions* software is a little more challenging. It contains the functions used by DG400a.xls. Students can use these functions to develop their own Excel worksheets in order to investigate particular issues and answer assignment questions.

Many instructors find DerivaGem to be a really useful resource. DerivaGem can be downloaded from www-2.rotman.utoronto.ca/~hull/software.

Slides

Several hundred PowerPoint slides accompany this book. They can be a useful starting point for instructors. Those who adopt the text are welcome to adapt the slides to meet their needs. These slides are available on www.pearsonglobaleditions.com and www-2.rotman.utoronto.ca/~hull.

Technical Notes

There are over 30 technical notes available. They are referred to in the text and can be downloaded from www-2.rotman.utoronto.ca/~hull/TechnicalNotes.

By not including the Technical Notes in the book, I am able to streamline the presentation of material so that it is more reader-friendly.

EMPLOYABILITY

A natural question for students is: “Will a course in derivatives improve my chances of a getting a job in finance?” The answer is an overwhelming yes. Probably the first thing many students think about when considering options or other derivatives is an exchange such as the CBOE. In fact, as Chapter 1 makes clear, the over-the-counter (OTC) market is much larger than the exchange-traded market and likely to be much more important to students in their first job (or subsequent jobs). *Options, Futures, and Other Derivatives* has a much bigger focus on the OTC market than most other derivatives texts.

Derivatives have steadily increased in importance. Potential employers can be classified as “buy side” and “sell side”. The buy side includes nonfinancial corporations, insurance companies, fund managers, and some other financial institutions. The sell side consists of large financial institutions who act as market makers. Many students who take courses in derivatives may not become derivatives traders or derivatives analysts. However, derivatives now permeate all aspects of finance. If you work in investment banking, there is likely to be a derivatives component to some of the deals you are involved in; if you work in fund management, you will probably find derivatives to be convenient tools for some purposes; if you work for a nonfinancial corporation, you may be involved in using derivative contracts for hedging and negotiating with a sell-side institution; and so on. Whatever your role in finance, it is important that you be able to talk about derivatives knowledgeably, use the right words, and understand the motivations of a counterparty to a transaction. A course based on *Options, Futures, and Other Derivatives* will help you do this.

What about those of you who want to specialize in derivatives? I have literally lost count of the many successful derivative executives who have told me “Thank you for your book. I read it before the interview, and it got me my first job in derivatives.” (My joking response has typically been: “Great, but you realize that means you owe me 20% of your first year’s salary.”) The people I am talking about typically had engineering, physics, or other quantitative backgrounds at the time of the interview but had never taken a course in finance! So, while the book is important for those planning a career in finance, it is absolutely essential reading for all those aspiring to a career in derivatives. As mentioned earlier, it is found on trading-room desks throughout the world.

This book will help you develop your quant skills so that you become more marketable in finance. But other skills are of course important. Good communication skills are

necessary. Many instructors ask students to present the results of projects in class. Students should take full advantage of these opportunities to practice and improve. If presentations are recorded, they should review the recording carefully.

At my business school, we used to run optional mock interviews and other self-development activities for students. Interestingly, the students that took advantage of them tended to be the ones that already had fairly good skills. The students that really needed help did not participate. (We have since made the activities mandatory.) I would urge all students to take advantage of all opportunities to improve their soft skills. Do not dismiss them as unimportant.

What are other important skills? The book discusses the regulatory environment for derivatives which changed a lot following the 2008 financial crisis. Make sure you understand the issues and are familiar with the latest developments. You should also use a derivatives course to help develop your critical thinking skills. Ask questions in class and do not be afraid to express an opinion about an issue.

A potential employer will want to be convinced that you can work well with others. While at university you will be involved in many group projects and should take this opportunity to develop good collaboration skills. You may find some members of your group difficult to work with, but this is also likely to be true in your first full-time job. Go to an interview prepared to talk about your experiences working with other students.

In addition to quant skills and knowledge of derivatives, I have mentioned that communication skills, the ability to work collaboratively, and critical thinking are soft skills that you should try and develop to make sure you get that first job. Another I might add is social responsibility. It is not an accident that most successful corporate executives are actively involved in community activities. Be prepared to talk about sustainable finance, which is an aspect of social responsibility and becoming an increasingly important area within finance.

ACKNOWLEDGMENTS

Many people have played a part in the development of successive editions of this book. Indeed, the list of people who have provided me with feedback on the book is now so long that it is not possible to mention everyone. I have benefited from the advice of many academics who have taught from the book and from the comments of many derivatives practitioners. I would like to thank the students in my courses at the University of Toronto who have made many suggestions on how the material can be improved. Eddie Mizzi from The Geometric Press did an excellent job editing the final manuscript and handling page composition. Emilio Barone from Luiss Guido Carli University in Rome provided many detailed comments. Andrés Olivé provided valuable research assistance.

Alan White, a colleague at the University of Toronto, deserves a special acknowledgment. Alan and I have been carrying out joint research and consulting in the areas of derivatives and risk management for over 30 years. During that time, we have spent many hours discussing key issues. Many of the new ideas in this book, and many of the new ways used to explain old ideas, are as much Alan's as mine. Alan has done most of the development work on the DerivaGem software.

Special thanks are due to the many people at Pearson I have worked with for over 30 years. Those who have worked with me on the 11th edition include Neeraj Bhalla,

Sugandh Juneja, and Emily Biberger. I would like to thank them for their enthusiasm, advice, and encouragement.

I welcome comments on the book from readers. My e-mail address is:

hull@rotman.utoronto.ca

John Hull

About the Author

John Hull is the Maple Financial Professor of Derivatives and Risk Management at the Joseph L. Rotman School of Management, University of Toronto. He was in 2016 awarded the title of University Professor (an honor granted to only 2% of faculty at the University of Toronto). He is an internationally recognized authority on derivatives and risk management and has many publications in this area. His work has an applied focus. He has acted as consultant to many financial institutions throughout the world and has won many teaching awards, including the University of Toronto's prestigious Northrop Frye award. His research and teaching activities include risk management, regulation, and machine learning, as well as derivatives. He is co-director of Rotman's Master of Finance and Master of Financial Risk Management programs.

1

C H A P T E R

Introduction

In the last 40 years, derivatives have become increasingly important in finance. Futures and options are actively traded on many exchanges throughout the world. Many different types of forward contracts, swaps, options, and other derivatives are entered into by financial institutions, fund managers, and corporate treasurers in the over-the-counter market. Derivatives are added to bond issues, used in executive compensation plans, embedded in capital investment opportunities, used to transfer risks in mortgages from the original lenders to investors, and so on. We have now reached the stage where those who work in finance, and many who work outside finance, need to understand how derivatives work, how they are used, and how they are priced.

Whether you love derivatives or hate them, you cannot ignore them! The derivatives market is huge—much bigger than the stock market when measured in terms of underlying assets. The value of the assets underlying outstanding derivatives transactions is several times the world gross domestic product. As we shall see in this chapter, derivatives can be used for hedging or speculation or arbitrage. They can transfer a wide range of risks in the economy from one entity to another.

A *derivative* involves two parties agreeing to a future transaction. Its value depends on (or derives from) the values of other underlying variables. Very often the variables underlying derivatives are the prices of traded assets. A stock option, for example, is a derivative whose value is dependent on the price of a stock. However, derivatives can be dependent on almost any variable, from the price of hogs to the amount of snow falling at a certain ski resort.

Since the first edition of this book was published in 1988 there have been many developments in derivatives markets. For example:

- Many new instruments such as credit derivatives, electricity derivatives, weather derivatives, and insurance derivatives have been developed.
- Many new types of interest rate, foreign exchange, and equity derivatives now trade.
- There have been many new ideas in risk management and risk measurement.
- Real option methods for capital investment appraisal have been developed.
- The financial crisis of 2008 occurred, with derivatives (perhaps unfairly) getting much of the blame.

- Many regulations affecting the over-the-counter derivatives market have been introduced.
- The “risk-free” discount rate used to value derivatives has changed and the decision has been taken to phase out LIBOR.
- Derivatives dealers now adjust the way they price derivatives to allow for credit risks, funding costs, and capital requirements.
- Collateral and credit issues are now given much more attention and have led to changes in the way derivatives are traded.
- Machine learning is now becoming widely used for managing derivatives portfolios.

The book has evolved to keep up to date with these developments. For example: the 2008 financial crisis is discussed in Chapter 8; changes in the interest rates used for derivatives pricing are discussed in Chapter 4; valuation adjustments are covered in Chapter 9; real options are explained in Chapter 36; credit derivatives are covered in Chapter 25; energy, weather, and insurance derivatives are covered in Chapter 35. Machine learning applications are discussed at various points in the book.

In this opening chapter, we take a first look at derivatives markets and how they are changing. We contrast exchange-traded and over-the-counter derivatives markets and review recent regulatory changes affecting the markets. We describe forward, futures, and options markets and provide examples of how they are used by hedgers, speculators, and arbitrageurs. Later in the book we will elaborate on many of the points made in this chapter.

1.1 EXCHANGE-TRADED MARKETS

A derivatives exchange is a market where individuals and companies trade standardized contracts that have been defined by the exchange. Derivatives exchanges have existed for a long time. The Chicago Board of Trade (CBOT) was established in 1848 to bring farmers and merchants together. Initially its main task was to standardize the quantities and qualities of the grains that were traded. Within a few years, the first futures-type contract was developed. It was known as a *to-arrive contract*. Speculators soon became interested in the contract and found trading the contract to be an attractive alternative to trading the grain itself. A rival futures exchange, the Chicago Mercantile Exchange (CME), was established in 1919. Now futures exchanges exist all over the world. (See table at the end of the book.) The CME and CBOT have merged to form the CME Group (www.cmegroup.com), which also includes the New York Mercantile Exchange (NYMEX), and the Kansas City Board of Trade (KCBT).

The Chicago Board Options Exchange (CBOE, www.cboe.com) started trading call option contracts on 16 stocks in 1973. Options had traded prior to 1973, but the CBOE succeeded in creating an orderly market with well-defined contracts. Put option contracts started trading on the exchange in 1977. The CBOE now trades options on thousands of stocks and many different stock indices. Like futures, options have proved to be very popular contracts. Many other exchanges throughout the world now trade

options. (See table at the end of the book.) The underlying assets include foreign currencies and futures contracts as well as stocks and stock indices.

Once two traders have agreed to trade a product offered by an exchange, it is handled by the exchange clearing house. This stands between the two traders and manages the risks. Suppose, for example, that trader A enters into a futures contract to buy 100 ounces of gold from trader B in six months for \$1,750 per ounce. The result of this trade will be that A has a contract to buy 100 ounces of gold from the clearing house at \$1,750 per ounce in six months and B has a contract to sell 100 ounces of gold to the clearing house for \$1,750 per ounce in six months. The advantage of this arrangement is that traders do not have to worry about the creditworthiness of the people they are trading with. The clearing house takes care of credit risk by requiring each of the two traders to deposit funds (known as margin) with the clearing house to ensure that they will live up to their obligations. Margin requirements and the operation of clearing houses are discussed in more detail in Chapter 2.

Electronic Markets

Traditionally derivatives exchanges have used what is known as the *open outcry system*. This involves traders physically meeting on the floor of the exchange, shouting, and using a complicated set of hand signals to indicate the trades they would like to carry out. Exchanges have largely replaced the open outcry system by *electronic trading*. This involves traders entering their desired trades at a keyboard and a computer being used to match buyers and sellers. The open outcry system has its advocates, but, as time passes, it is becoming less and less used.

Electronic trading has led to a growth in high-frequency trading. This involves the use of algorithms to initiate trades, often without human intervention, and has become an important feature of derivatives markets.

1.2 OVER-THE-COUNTER MARKETS

Not all derivatives trading is on exchanges. Many trades take place in the *over-the-counter* (OTC) market. Banks, other large financial institutions, fund managers, and corporations are the main participants in OTC derivatives markets. Once an OTC trade has been agreed, the two parties can either present it to a central counterparty (CCP) or clear the trade bilaterally. A CCP is like an exchange clearing house. It stands between the two parties to the derivatives transaction so that one party does not have to bear the risk that the other party will default. When trades are cleared bilaterally, the two parties have usually signed an agreement covering all their transactions with each other. The issues covered in the agreement include the circumstances under which outstanding transactions can be terminated, how settlement amounts are calculated in the event of a termination, and how the collateral (if any) that must be posted by each side is calculated. CCPs and bilateral clearing are discussed in more detail in Chapter 2.

Large banks often act as market makers for the more commonly traded instruments. This means that they are always prepared to quote a bid price (at which they are prepared to take one side of a derivatives transaction) and an ask price (at which they are prepared to take the other side).

Business Snapshot 1.1 The Lehman Bankruptcy

On September 15, 2008, Lehman Brothers filed for bankruptcy. This was the largest bankruptcy in U.S. history and its ramifications were felt throughout derivatives markets. Almost until the end, it seemed as though there was a good chance that Lehman would survive. A number of companies (e.g., the Korean Development Bank, Barclays Bank in the United Kingdom, and Bank of America) expressed interest in buying it, but none of these was able to close a deal. Many people thought that Lehman was “too big to fail” and that the U.S. government would have to bail it out if no purchaser could be found. This proved not to be the case.

How did this happen? It was a combination of high leverage, risky investments, and liquidity problems. Commercial banks that take deposits are subject to regulations on the amount of capital they must keep. Lehman was an investment bank and not subject to these regulations. By 2007, its leverage ratio had increased to 31:1, which means that a 3–4% decline in the value of its assets would wipe out its capital. Dick Fuld, Lehman’s Chairman and Chief Executive Officer, encouraged an aggressive deal-making, risk-taking culture. He is reported to have told his executives: “Every day is a battle. You have to kill the enemy.” The Chief Risk Officer at Lehman was competent, but did not have much influence and was even removed from the executive committee in 2007. The risks taken by Lehman included large positions in the instruments created from subprime mortgages, which will be described in Chapter 8. Lehman funded much of its operations with short-term debt. When there was a loss of confidence in the company, lenders refused to renew this funding, forcing it into bankruptcy.

Lehman was very active in the over-the-counter derivatives markets. It had over a million transactions outstanding with about 8,000 different counterparties. Lehman’s counterparties were often required to post collateral and this collateral had in many cases been used by Lehman for various purposes. Litigation aimed at determining who owes what to whom continued for many years after the bankruptcy filing.

Prior to the financial crisis, which started in 2007 and is discussed in some detail in Chapter 8, OTC derivatives markets were largely unregulated. Following the financial crisis and the failure of Lehman Brothers (see Business Snapshot 1.1), we have seen the development of many new regulations affecting the operation of OTC markets. The main objectives of the regulations are to improve the transparency of OTC markets and reduce systemic risk (see Business Snapshot 1.2). The over-the-counter market in some respects is being forced to become more like the exchange-traded market. Three important changes are:

1. Standardized OTC derivatives between two financial institutions in the United States must, whenever possible, be traded on what are referred to as *swap execution facilities* (SEFs). These are platforms similar to exchanges where market participants can post bid and ask quotes and where market participants can trade by accepting the quotes of other market participants.
2. There is a requirement in most parts of the world that a CCP be used for most standardized derivatives transactions between financial institutions.
3. All trades must be reported to a central repository.

Business Snapshot 1.2 Systemic Risk

Systemic risk is the risk that a default by one financial institution will create a “ripple effect” that leads to defaults by other financial institutions and threatens the stability of the financial system. There are huge numbers of over-the-counter transactions between banks. If Bank A fails, Bank B may take a huge loss on the transactions it has with Bank A. This in turn could lead to Bank B failing. Bank C that has many outstanding transactions with both Bank A and Bank B might then take a large loss and experience severe financial difficulties; and so on.

The financial system has survived defaults such as Drexel in 1990 and Lehman Brothers in 2008, but regulators continue to be concerned. During the market turmoil of 2007 and 2008, many large financial institutions were bailed out, rather than being allowed to fail, because governments were concerned about systemic risk.

Market Size

Both the over-the-counter and the exchange-traded market for derivatives are huge. The number of derivatives transactions per year in OTC markets is smaller than in exchange-traded markets, but the average size of the transactions is much greater. Although the statistics that are collected for the two markets are not exactly comparable, it is clear that the volume of business in the over-the-counter market is much larger than in the exchange-traded market. The Bank for International Settlements (www.bis.org) started collecting statistics on the markets in 1998. Figure 1.1 compares (a) the estimated total principal amounts underlying transactions that were outstanding in the over-the-counter markets between June 1998 and December 2019 and (b) the estimated total value of the assets underlying exchange-traded contracts during the same period. Using these measures, the size of the over-the-counter market in December 2019 was \$558.5 trillion

Figure 1.1 Size of over-the-counter and exchange-traded derivatives markets.

and the size of the exchange-traded market was \$96.5 trillion.¹ Figure 1.1 shows that the OTC market grew rapidly up to 2007, but has seen very little net growth since then. One reason for the lack of growth is the popularity of *compression*. This is a procedure where two or more counterparties restructure transactions with each other with the result that the underlying principal is reduced.

In interpreting Figure 1.1, we should bear in mind that the principal underlying an over-the-counter transaction is not the same as its value. An example of an over-the-counter transaction is an agreement to buy 100 million U.S. dollars with British pounds at a predetermined exchange rate in 1 year. The total principal amount underlying this transaction is \$100 million. However, the value of the transaction might be only \$1 million. The Bank for International Settlements estimates the gross market value of all over-the-counter transactions outstanding in December 2019 to be about \$11.6 trillion.²

1.3 FORWARD CONTRACTS

A relatively simple derivative is a *forward contract*. It is an agreement to buy or sell an asset at a certain future time for a certain price. It can be contrasted with a *spot contract*, which is an agreement to buy or sell an asset almost immediately. A forward contract is traded in the over-the-counter market—usually between two financial institutions or between a financial institution and one of its clients.

One of the parties to a forward contract assumes a *long position* and agrees to buy the underlying asset on a certain specified future date for a certain specified price. The other party assumes a *short position* and agrees to sell the asset on the same date for the same price.

Forward contracts on foreign exchange are very popular. Most large banks employ both spot and forward foreign-exchange traders. As we shall see in Chapter 5, there is a relationship between forward prices, spot prices, and interest rates in the two currencies. Table 1.1 provides quotes for the exchange rate between the British pound (GBP) and the U.S. dollar (USD) that might be made by a large international bank on May 21, 2020. The quote is for the number of USD per GBP. The first row indicates that the

Table 1.1 Spot and forward quotes for the exchange rate between USD and GBP on May 21, 2020 (GBP = British pound; USD = U.S. dollar; quote is number of USD per GBP).

	<i>Bid</i>	<i>Ask</i>
Spot	1.2217	1.2220
1-month forward	1.2218	1.2222
3-month forward	1.2220	1.2225
6-month forward	1.2224	1.2230

¹ When a CCP stands between two sides in an OTC transaction, two transactions are considered to have been created for the purposes of the BIS statistics.

² A contract that is worth \$1 million to one side and −\$1 million to the other side would be counted as having a gross market value of \$1 million.

bank is prepared to buy GBP (also known as sterling) in the spot market (i.e., for virtually immediate delivery) at the rate of \$1.2217 per GBP and sell sterling in the spot market at \$1.2220 per GBP. The second, third, and fourth rows indicate that the bank is prepared to buy sterling in 1, 3, and 6 months at \$1.2218, \$1.2220, and \$1.2224 per GBP, respectively, and to sell sterling in 1, 3, and 6 months at \$1.2222, \$1.2225, and \$1.2230 per GBP, respectively.

Forward contracts can be used to hedge foreign currency risk. Suppose that, on May 21, 2020, the treasurer of a U.S. corporation knows that the corporation will pay £1 million in 6 months (i.e., on November 21, 2020) and wants to hedge against exchange rate moves. Using the quotes in Table 1.1, the treasurer can agree to buy £1 million 6 months forward at an exchange rate of 1.2230. The corporation then has a long forward contract on GBP. It has agreed that on November 21, 2020, it will buy £1 million from the bank for \$1.2230 million. The bank has a short forward contract on GBP. It has agreed that on November 21, 2020, it will sell £1 million for \$1.2230 million. Both sides have made a binding commitment.

Payoffs from Forward Contracts

Consider the position of the corporation in the trade we have just described. What are the possible outcomes? The forward contract obligates the corporation to buy £1 million for \$1,223,000. If the spot exchange rate rose to, say, 1.3000, at the end of the 6 months, the forward contract would be worth \$77,000 ($= \$1,300,000 - \$1,223,000$) to the corporation. It would enable £1 million to be purchased at an exchange rate of 1.2230 rather than 1.3000. Similarly, if the spot exchange rate fell to 1.2000 at the end of the 6 months, the forward contract would have a negative value to the corporation of \$23,000 because it would lead to the corporation paying \$23,000 more than the market price for the sterling.

In general, the payoff from a long position in a forward contract on one unit of an asset is

$$S_T - K$$

where K is the delivery price and S_T is the spot price of the asset at maturity of the contract. This is because the holder of the contract is obligated to buy an asset worth S_T for K . Similarly, the payoff from a short position in a forward contract on one unit of an asset is

$$K - S_T$$

These payoffs can be positive or negative. They are illustrated in Figure 1.2. Because it costs nothing to enter into a forward contract, the payoff from the contract is also the trader's total gain or loss from the contract.

In the example just considered, $K = 1.2230$ and the corporation has a long contract. When $S_T = 1.3000$, the payoff is \$0.077 per £1; when $S_T = 1.2000$, it is $-\$0.023$ per £1.

Forward Prices and Spot Prices

We shall be discussing in some detail the relationship between spot and forward prices in Chapter 5. For a quick preview of why the two are related, consider a stock that pays no dividend and is worth \$60. You can borrow or lend money for 1 year at 5%. What should the 1-year forward price of the stock be?

Figure 1.2 Payoffs from forward contracts: (a) long position, (b) short position.
 Delivery price = K ; price of asset at contract maturity = S_T .

The answer is \$60 grossed up at 5% for 1 year, or \$63. If the forward price is more than this, say \$67, you could borrow \$60, buy one share of the stock, and sell it forward for \$67. After paying off the loan, you would net a profit of \$4 in 1 year. If the forward price is less than \$63, say \$58, an investor owning the stock as part of a portfolio would sell the stock for \$60 and enter into a forward contract to buy it back for \$58 in 1 year. The proceeds of investment would be invested at 5% to earn \$3. The investor would end up \$5 better off than if the stock were kept in the portfolio for the year.

1.4 FUTURES CONTRACTS

Like a forward contract, a futures contract is an agreement between two parties to buy or sell an asset at a certain time in the future for a certain price. Unlike forward contracts, futures contracts are normally traded on an exchange. To make trading possible, the exchange specifies certain standardized features of the contract. As the two parties to the contract do not necessarily know each other, the exchange clearing house stands between them as mentioned earlier.

Two large exchanges on which futures contracts are traded are the Chicago Board of Trade (CBOT) and the Chicago Mercantile Exchange (CME), which have now merged to form the CME Group. On these and other exchanges throughout the world, a very wide range of commodities and financial assets form the underlying assets in the various contracts. The commodities include pork bellies, live cattle, sugar, wool, lumber, copper, aluminum, gold, and tin. The financial assets include stock indices, currencies, and Treasury bonds. Futures prices are regularly reported in the financial press. Suppose that, on September 1, the December futures price of gold is quoted as \$1,750. This is the price, exclusive of commissions, at which traders can agree to buy or sell gold for December delivery. It is determined in the same way as other prices (i.e., by the laws of supply and demand). If more traders want to go long than to go short, the price goes up; if the reverse is true, then the price goes down.
