about the authors:

Robert Siegler is the Teresa Heinz Professor of Cognitive Psychology at Carnegie Mellon University. He is author of the cognitive development textbook *Children's Thinking* and has written or edited several additional books on child development. His books have been translated into Japanese, Chinese, Korean, Spanish, French, Greek, Hebrew, and Portuguese. In the past few years, he has presented keynote addresses at the conventions of the Cognitive Development Society, the International Society for the Study of Behavioral Development, the Japanese Psychological Association, the Eastern Psychological Association, the American Psychological Society, and the Conference on Human Development. He also has served as Associate Editor of the journal *Developmental Psychology*, co-edited the cognitive development volume of the 2006 *Handbook of Child Psychology*, and served on the National Mathematics Advisory Panel from 2006 to 2008. Dr. Siegler received the American Psychological Association's Distinguished Scientific Contribution Award in 2005, was elected to the National Academy of Education in 2010, and was named Director of the Siegler Center for Innovative Learning at Beijing Normal University in 2012.

Judy DeLoache is the William R. Kenan Jr. Professor of Psychology at the University of Virginia. She has published extensively on aspects of cognitive development in infants and young children. Dr. DeLoache has served as President of the Developmental Division of the American Psychological Association, as President of the Cognitive Development Society, and as a member of the executive board of the International Society for the Study of Infancy. She has presented major invited addresses at professional meetings, including the Association for Psychological Science and the Society for Research in Child Development. Dr. DeLoache is the holder of a Scientific MERIT Award from the National Institutes of Health, and her research is also funded by the National Science Foundation. She has been a visiting fellow at the Center for Advanced Study in the Behavioral Sciences in Palo Alto, California, and at the Rockefeller Foundation Study Center in Bellagio, Italy. She is a Fellow of the National Academy of Arts and Sciences. In 2013, she received the Distinguished Research Contributions Award from the Society for Research in Child Development and the William James Award for Distinguished Contributions to Research from the Association for Psychological Science.

Nancy Eisenberg is Regents' Professor of Psychology at Arizona State University. Her research interests include social, emotional, and moral development, as well as socialization influences, especially in the areas of self-regulation and adjustment. She has published numerous empirical studies, as well as books and chapters on these topics. She has also been editor of *Psychological Bulletin* and the *Handbook of Child Psychology* and was the founding editor of the Society for Research in Child Development journal *Child Development Perspectives*. Dr. Eisenberg has been a recipient of Research Scientist Development Awards and a Research Scientist Award from the National Institutes of Health (NICHD and NIMH). She has served as President of the Western Psychological Association and of Division 7 of the American Psychological Association and is president-elect of the Association for Psychological Science. She is the 2007 recipient of the Ernest R. Hilgard Award for a Career Contribution to General Psychology, Division 1, American Psychological Association; the 2008 recipient of the International Society for the Study of Behavioral Development Distinguished Scientific Contribution Award; the 2009 recipient of the G. Stanley Hall Award for Distinguished Contribution to Developmental Psychology, Division 7, American Psychological Association; and the 2011 William James

Fellow Award for Career Contributions in the Basic Science of Psychology from the Association for Psychological Science.

Jenny R. Saffran is the College of Letters & Science Distinguished Professor of Psychology at the University of Wisconsin–Madison, and an investigator at the Waisman Center. Her research is focused on learning in infancy and early childhood, with a particular focus on language. Dr. Saffran currently holds a MERIT award from the Eunice Kennedy Shriver National Institute of Child Health and Human Development. She has been the recipient of numerous awards for her scientific research, including the Boyd McCandless Award from the American Psychological Association for early career contributions to developmental psychology, and the Presidential Early Career Award for Scientists and Engineers from the National Science Foundation.

contents:

Preface xx

Chapter 1 An Introduction to Child Development 1

Reasons to Learn About Child Development 3

- Raising Children 3
- Choosing Social Policies 4
- Understanding Human Nature 6
- Review 7

Historical Foundations of the Study of Child Development 7

- Early Philosophers' Views of Children's Development 8
- Social Reform Movements 9
- Darwin's Theory of Evolution 9
- The Beginnings of Research-Based Theories of Child Development 10
- Review 10

Enduring Themes in Child Development 10

1. *Nature and Nurture*: How Do Nature and Nurture Together Shape Development? 10
 2. *The Active Child*: How Do Children Shape Their Own Development? 12
 3. *Continuity/Discontinuity*: In What Ways Is Development Continuous, and in What Ways Is It Discontinuous? 13
 4. *Mechanisms of Development*: How Does Change Occur? 16
 5. *The Sociocultural Context*: How Does the Sociocultural Context Influence Development? 17
 6. *Individual Differences*: How Do Children Become So Different from One Another? 20
 7. *Research and Children's Welfare*: How Can Research Promote Children's Well-Being? 21
- Review 22

Methods for Studying Child Development 22

preface:

This is an exciting time in the field of child development. The past decade has brought new theories, new ways of thinking, new areas of research, and innumerable new findings to the field. We originally wrote *How Children Develop* to describe this ever-improving body of knowledge of children and their development and to convey our excitement about the progress that is being made in understanding the developmental process. We are pleased to continue this endeavor with the publication of the fourth edition of *How Children Develop*.

As teachers of child development courses, we appreciate the challenge that instructors face in trying to present these advances and discoveries—as well as the major older ideas and findings—in a one-semester course. Therefore, rather than aim at encyclopedic coverage, we have focused on identifying the most important developmental phenomena and describing them in sufficient depth to make them meaningful and memorable to students. In short, our goal has been to write a textbook that makes the child development course coherent and enjoyable for students and teachers alike.

Classic Themes

The basic premise of the book is that all areas of child development are unified by a small set of enduring themes. These themes can be stated in the form of questions that child development research tries to answer:

1. How do nature and nurture together shape development?
2. How do children shape their own development?
3. In what ways is development continuous and in what ways is it discontinuous?
4. How does change occur?
5. How does the sociocultural context influence development?
6. How do children become so different from one another?
7. How can research promote children's well-being?

These seven themes provide the core structure of the book. They are introduced and illustrated in Chapter 1, highlighted repeatedly, where relevant, in the subsequent fourteen content chapters, and utilized in the final chapter as a framework for integrating findings relevant to each theme from all areas of development. The continuing coverage of these themes allows us to tell a story that has a beginning (the introduction of the themes), a middle (discussion of specific findings relevant to them), and an ending (the overview of what students have learned about the themes). We believe that this thematic emphasis and structure will not only help students to understand enduring questions about child development but will also leave them with a greater sense of satisfaction and completion at the end of the course.

Contemporary Perspective

The goal of providing a thoroughly contemporary perspective on how children develop has influenced the organization of our book as well as its contents. Whole new areas and perspectives have emerged that barely existed when most of today's child development textbooks were originally written. The organization of *How Children Develop* is designed to present these new topics and approaches in the context of the field as it currently stands, rather than trying to shoehorn them into organizations that once fit the field but no longer do.

Consider the case of Piaget's theory and current research relevant to it. Piaget's theory often is presented in its own chapter, most of which describes the theory in full detail and the rest of which offers contemporary research that demonstrates problems with the theory. This approach often leaves students wondering why so much time was spent on Piaget's theory if modern research shows it to be wrong in so many ways.

The fact is that the line of research that began over 40 years ago as an effort to challenge Piaget's theory has emerged since then as a vital area in its own right—the area of conceptual development. Research in conceptual development provides extensive information on such fascinating topics as children's understanding of human beings, plants and animals, and the physical universe. As with other research areas, most studies in this field are aimed primarily at uncovering evidence relevant to current claims, not those of Piaget.

We adapted to this changing intellectual landscape in two ways. First, our chapter “Theories of Cognitive Development” (Chapter 4) describes the fundamental aspects of Piaget's theory in depth and honors his legacy by focusing on the aspects of his work that have proven to be the most enduring. Second, a first-of-its-kind chapter called “Conceptual Development” (Chapter 7) addresses the types of issues that inspired Piaget's theory but concentrates on modern perspectives and findings regarding those issues. This approach allows us to tell students about the numerous intriguing proposals and observations that are being made in this field, without the artificiality of classifying the findings as “pro-Piagetian” or “anti-Piagetian.”

The opportunity to create a textbook based on current understanding also led us to assign prominent positions to such rapidly emerging areas as epigenetics, behavioral genetics, brain development, prenatal learning, infant cognition, acquisition of academic skills, emotional development, prosocial behavior, and friendship patterns. All these areas have seen major breakthroughs in recent years, and their growing prominence has led to even greater emphasis on them in this edition.

Getting Right to the Point

Our desire to offer a contemporary, streamlined approach led to other departures from the traditional organization. It is our experience that today's students take child development courses for a variety of practical reasons and are eager to learn about *children*. Traditionally, however, they have had to wait two or three or even four chapters—on the history of the field, on major theories, on research methods, on genetics—before actually getting to the study of children. We wanted to build on their initial motivation from the start.

Rather than beginning the book, then, with an extensive examination of the history of the field, we include in Chapter 1 a brief overview of the social and intellectual context in which the scientific study of children arose and provide historical

background wherever it is pertinent in subsequent chapters. Rather than have an early “blockbuster” theories chapter that covers all the major cognitive and social theories at once (at a point far removed from the content chapters to which the theories apply), we present a chapter on cognitive developmental theories just before the chapters that focus on specific aspects of cognitive development, and we similarly present a chapter on social developmental theories just before the chapters that focus on specific aspects of social development. Rather than have a separate chapter on genetics, we include basic aspects of genetics as part of Chapter 3, “Biology and Behavior,” and then discuss the contributions of genetics to some of the differences among individuals throughout the book. When we originally chose this organization, we hoped that it would allow us, from the first weeks of the course, to kindle students’ enthusiasm for finding out how children develop. Judging by the overwhelmingly positive response we have received from students and instructors alike, it has.

Features

The most important feature of this book is the exposition, which we have tried to make as clear, compelling, and interesting as possible. As in previous editions, we have given extra attention to making it accessible to a broad range of students.

To further enhance the appeal and accessibility of the text, we have retained three types of discussion boxes that explore topics of special interest. “Applications” boxes focus on how child development research can be used to promote children’s well-being. Among the applications that are summed up in these boxes are board-game procedures for improving preschoolers’ understanding of numbers; the Carolina Abecedarian Project; interventions to reduce child abuse; programs, such as PATHS, for helping rejected children gain acceptance from their peers; and Fast Track interventions, which help aggressive children learn how to manage their anger and antisocial behavior. “Individual Differences” boxes focus on populations that differ from the norm with regard to the specific topic under consideration, or on variations among children in the general population. Some of these boxes highlight developmental problems such as autism, ADHD, dyslexia, specific language impairment, and conduct disorder, while others focus on differences in the development of children that center on attachment status, gender, and cultural differences. “A Closer Look” boxes examine important and interesting research in greater depth than would otherwise be possible: the areas examined range from brain imaging techniques to discrepant gender identity to the developmental impact of homelessness.

We have also retained a number of other features intended to improve students’ learning. These features include boldfacing key terms and supplying definitions both within the immediate text and in marginal glossaries; providing summaries at the end of each major section, as well as summaries for the overall chapter; and, at the end of each chapter, posing critical thinking questions intended to promote deeper consideration of essential topics.

New to the Fourth Edition

We have expanded our coverage of a number of research areas that have become increasingly important in recent years for both the students of child development and the instructors who teach it. In the following paragraphs, we outline some of

the highlights of the fourth edition. Thank you for taking the time to look through this new edition of *How Children Develop*. We hope that you find it to be useful and appealing.

New and Expanded Coverage

In selecting what to cover from among the many new discoveries about child development, we have emphasized the studies that strike us as the most interesting and important. While retaining and thoroughly updating its essential coverage, the fourth edition of *How Children Develop* continues to explore a number of fascinating areas in which there has been great progress in the past few years. Following is a very brief sampling of the many areas of new and expanded coverage:

- Epigenetics
- Gene–environment relations, including methylation
- The role of specific gene variants in certain behaviors
- Differential susceptibility to the environment
- Brain development and functioning
- Mechanisms of infants’ learning
- Infants’ understanding of other people
- Executive functioning
- Cultural influences on development
- Relations among understanding of time, space, and number
- Mathematics anxiety
- Applications of research to education
- The growing role and impact of social media in children’s and adolescents’ lives
- Interventions to foster children’s social adjustment

Supplements

How Children Develop, Fourth Edition, features a wide array of multimedia tools designed for the individual needs of students and teachers. For more information about any of the items below, visit Worth Publishers’ online catalog at www.worthpublishers.com.

LaunchPad with LearningCurve Quizzing

A comprehensive Web resource for teaching and learning psychology

LaunchPad combines Worth Publishers’ awarding-winning media with an innovative platform for easy navigation. For students, it is the ultimate online study guide with rich interactive tutorials, videos, e-Book, and the LearningCurve adaptive quizzing system. For instructors, LaunchPad is a full course space where class documents can be posted, quizzes are easily assigned and graded, and students’ progress can be assessed and recorded. Whether you are looking for the most effective study tools or a robust platform for an online course, LaunchPad is a powerful way to enhance your class.

LaunchPad for *How Children Develop*, Fourth Edition, can be previewed and purchased at <http://www.worthpublishers.com/launchpad/siegler4e>.

How Children Develop, Fourth Edition, and LaunchPad can be ordered together with ISBN 10: 1-4641-8284-1 / ISBN-13: 978-1-4641-8284-6.

LaunchPad for *How Children Develop*, Fourth Edition, includes the following resources:

- The **LearningCurve** quizzing system was designed based on the latest findings from learning and memory research. It combines adaptive question selection, immediate and valuable feedback, and a game-like interface to engage students in a learning experience that is unique to them. Each LearningCurve quiz is fully integrated with other resources in LaunchPad through the Personalized Study Plan, so students will be able to review with Worth's extensive library of videos and activities. And state-of-the-art question analysis reports allow instructors to track the progress of individual students as well as their class as a whole.
- **An interactive e-Book** allows students to highlight, bookmark, and make their own notes, just as they would with a printed textbook. Digital enhancements include full-text search and in-text glossary definitions.
- **Student Video Activities** include more than 100 engaging video modules that instructors can easily assign for student assessment. Videos cover classic experiments, current news footage, and cutting-edge research, all of which are sure to spark discussion and encourage critical thinking.
- The **Scientific American Newsfeed** delivers weekly articles, podcasts, and news briefs on the very latest developments in psychology from the first name in popular science journalism.

Additional Student Supplements

CourseSmart e-Book

The CourseSmart e-Book offers the complete text of *How Children Develop*, Fourth Edition, in an easy-to-use, flexible format. Students can choose to view the CourseSmart e-Book online or download it to a personal computer or a portable media player, such as a smart phone or iPad. The CourseSmart e-Book for *How Children Develop*, Fourth Edition, can be previewed and purchased at www.coursesmart.com.

Scientific American Reader to Accompany *How Children Develop*

The authors have compiled fifteen *Scientific American* articles relevant to key topics in the text. The selections range from classics such as Harry Harlow's "Love in Infant Monkeys" and Eleanor Gibson and Richard Walk's "The 'Visual Cliff'" to

contemporary articles on such topics as the interaction of games and environment in the development of intelligence (Robert Plomin and John DeFries), the effects of child abuse on the developing brain (Martin Teicher), balancing work and family (Robert Pleck), and moral development (William Damon). These articles should enrich students' learning and help them to appreciate the process by which developmental scientists gain new understanding. This premium item can be packaged with the text at no additional cost.

Take advantage of our most popular supplements!

Worth Publishers is pleased to offer cost-saving packages of *How Children Develop*, Fourth Edition, with our most popular supplements. Below is a list of some of the most popular combinations available for order through your local bookstore.

How Children Develop, 4th Ed. & LaunchPad Access Card
ISBN 10: 1-4641-8284-1 / ISBN-13: 978-1-4641-8284-6

How Children Develop, 4th Ed. & iClicker
ISBN 10: 1-4641-8283-3 / ISBN-13: 978-1-4641-8283-9

How Children Develop, 4th Ed. & *Scientific American* Reader
ISBN 10: 1-4641-8282-5 / ISBN-13: 978-1-4641-8282-2

How Children Develop, 4th Ed. & *Readings on the Development of Children*
ISBN 10: 1-4641-8281-7 / ISBN-13: 978-1-4641-8281-5

Presentation and Faculty Support

Presentation Slides

Presentation slides are available in three formats that can be used as they are or can be customized. One set includes all the textbook's illustrations and tables. The second set consists of lecture slides that focus on key themes and terms in the book and include text illustrations and tables. A third set of PowerPoint slides provides an easy way to integrate the supplementary video clips into classroom lectures. All these prebuilt PowerPoint presentations are available through <http://www.worthpublishers.com/launchpad/siegler4e>.

Presentation Videos

Worth's video clips for development psychology span the full range of topics for the child development course. With hundreds of clips to choose from, this premium collection includes research and news footage on topics ranging from prenatal development to the experience of child soldiers to empathy in adolescence. These clips are made available to instructors for lecturing in the classroom and also through LaunchPad.

Instructor's Resource Manual

Written by Lynne Baker-Ward, North Carolina State University, this innovative *Instructor's Resource Manual* includes handouts for student projects, reading lists of journal articles, course-planning suggestions, and supplementary readings, in addition

to lecture guides, chapter overviews, and learning objectives. The Instructor's Resource Manual can be downloaded at <http://www.worthpublishers.com/launchpad/siegler4e>.

New! Faculty Lounge

Faculty Lounge is an online forum provided by Worth Publishers where teachers can find and share favorite teaching ideas and materials, including videos, animations, images, PowerPoint slides, news stories, articles, Web links, and lecture activities. Sign up to browse the site or upload your favorite materials for teaching psychology at www.worthpublishers.com/facultylounge.

Assessment

Test Bank

The Test Bank for *How Children Develop* by Jill L. Saxon features 80 multiple-choice and 20 essay questions for each chapter. Each question is keyed to the textbook by topic, type, and level of difficulty.

Test Bank on CD-ROM

The *Diploma Test Bank CD-ROM*, on a dual platform for Windows and Macintosh, guides instructors through the process of creating a test and allows them to add, edit, and scramble questions; to change formats; and to include pictures, equations, and media links. The CD-ROM is also the access point for Diploma Online Testing, which allows creating and administering examinations on paper, over a network, or over the Internet.

iClicker

The iClicker Classroom Response System is a versatile polling system developed by educators for educators that makes class time more efficient and interactive. iClicker allows you to ask questions and instantly record your students' responses, take attendance, and gauge students' understanding and opinions. iClicker is available at a 10% discount when packaged with *How Children Develop*, Fourth Edition.

Course Management

Worth Publishers supports multiple Course Management Systems with enhanced cartridges for upload into Blackboard, Angel, Desire2Learn, Sakai, and Moodle (and others upon request). Cartridges are provided free upon adoption of *How Children Develop*, Fourth Edition, and can be downloaded through the catalog page at www.worthpublishers.com.

Acknowledgments

So many people have contributed (directly and indirectly) to this textbook that it is impossible to know where to start or where to stop in thanking them. All of us have been given exceptional support by our spouses and significant oth-

ers—Jerry Clore, Jerry Harris, Xiaodong Lin, and Seth Pollak—and by our children—Benjamin Clore; Michael Harris; Todd, Beth, and Aaron Siegler; Avianna McGhee; and Eli and Nell Pollak—as well as by our parents, relatives, friends, and other loved ones. Our advisors in college and graduate school, Richard Aslin, Ann Brown, Les Cohen, Harry Hake, Robert Liebert, Jim Morgan, Paul Mussen, Ellisa Newport, and Jim Pate, helped to launch our careers and taught us how to recognize and appreciate good research. We also have all benefited from collaborators who shared our quest for understanding child development and from a great many exceptionally helpful and generous colleagues, including Karen Adolph, Martha Alibali, Renee Baillargeon, Sharon Carver, Zhe Chen, Richard Fabes, Cindy Fisher, Melanie Jones, David Klahr, Patrick Lemaire, Angeline Lillard, John Opfer, Kristin Shutts, Tracy Spinrad, David Uttal, and Carlos Valiente. We owe special thanks to our assistants, Sheri Towe and Theresa Treasure, who helped in innumerable ways in preparing the book.

We would also like to thank the many reviewers who contributed to this and previous editions: **Daisuke Akiba**, Queens College, City University of New York; **Kimberly Alkins**, Queens College, City University of New York; **Lynne Baker-Ward**, North Carolina State University; **Hilary Barth**, Wesleyan University; **Christopher Beevers**, Texas University; **Martha Bell**, Virginia Tech; **Cynthia Berg**, University of Utah; **Rebecca Bigler**, Texas University; **Margaret Borkowski**, Saginaw Valley State University; **Eric Buhs**, University of Nebraska–Lincoln; **G. Leonard Burns**, Washington State University; **Wendy Carlson**, Shenandoah University; **Kristi Cordell-McNulty**, Angelo State University; **Myra Cox**, Harold Washington College; **Emily Davidson**, Texas A&M University–Main Campus; **Ed de St. Aubin**, Marquette University; **Marissa Diener**, University of Utah; **Sharon Eaves**, Shawnee State University; **Urminda Firlan**, Grand Rapids Community College; **Dorothy Fragaszy**, University of Georgia; **Jeffery Gagne**, University of Texas–Austin; **Jennifer Ganger**, University of Pittsburgh; **Alice Ganzel**, Cornell College; **Janet Gebelt**, Westfield State University; **Melissa Ghera**, St. John Fisher College; **Susan Graham**, University of Calgary; **Andrea Greenhoot**, University of Kansas; **Frederick Grote**, Western Washington University; **John Gruszko**, Reynolds University; **Hanna Gustafsson**, University of North Carolina; **Alma Guyse**, Midland College; **Lauren Harris**, Michigan State University; **Karen Hartlep**, California State University–Bakersfield; **Patricia Hawley**, University of Kansas–Main; **Susan Hespos**, Northwestern University; **Doris Hiatt**, Monmouth University; **Susan Holt**, Central Connecticut State University; **Lisa Huffman**, Ball State University; **Kathryn Kipp**, University of Georgia; **Rosemary Krawczyk**, Minnesota State University; **Raymond Krukovsky**, Union County College; **Tara Kuther**, Western Connecticut State University; **Richard Lanthier**, George Washington University; **Elida Laski**, Boston College; **Kathryn Lemery**, Arizona State University; **Barbara Licht**, Florida State University; **Angeline Lillard**, University of Virginia; **Wayne McMillin**, Northwestern State University; **Martha Mendez-Baldwin**, Manhattan College; **Scott Miller**, University of Florida; **Keith Nelson**, Pennsylvania State University–Main Campus; **Paul Nicodemus**, Austin Peay State University; **Katherine O’Doherty**, Vanderbilt University; **John Opfer**, The Ohio State University; **Ann Repp**, Texas University; **Leigh Shaw**, Weber State University; **Jennifer Simonds**, Westminster College; **Rebekah Smith**, University of Texas–San Antonio; **Mark Strauss**, University of Pittsburgh–Main; **Spencer Thompson**, University of Texas–Permian Basin; **Lisa Travis**, University of Illinois Urbana–Champaign; **Roger Webb**, University of Arkansas–Little Rock; **Keri Weed**, University of South Carolina–Aiken; **Sherri Widen**, Boston College.

We would especially like to thank Campbell Leaper, University of California–Santa Cruz, for his major contributions to the revision of our chapter on gender development (Chapter 15). We are indebted to Campbell for bringing to the fourth edition his expertise and keen insight in this important area.

Thanks are particularly due to our friends and collaborators at Worth Publishers. As acquisitions editor and publisher, respectively, Daniel DeBonis and Kevin Feyen provided exceptional support and any number of excellent suggestions. We would also like to thank Marge Byers, who nurtured our first edition from its inception and helped us to realize our vision. Peter Deane, our development editor, is in a class by himself in both skill and dedication. Peter’s creative thinking and firm understanding of the field enhanced the content of the book in innumerable ways. We are deeply grateful to him. Our thanks go also to assistant editor Nadina Persaud, senior project editor Vivien Weiss, director of development (print and digital) Tracey Kuehn, art director Barbara Reingold, cover and text designer Kevin Kall, photo editor Bianca Moscatelli, photo researcher Elyse Rieder, production manager Sarah Segal, and compositor Northeastern Graphic for their excellent work. They have helped to create a book that we hope you will find a pleasure to look at as well as to read. Marketing manager Katherine Nurre provided outstanding promotional materials to inform professors about the book. Anthony Casciano and Stacey Alexander managed the superb package of ancillary material.

Finally, we want to thank our “book team” of sales representatives and managers. Tom Kling, Julie Hirshman, Kari Ewalt, Greg David, Tom Scotty, Cindy Rabinowitz, Glenn Russell, and Matt Dunning provided a sales perspective, valuable suggestions, and unflagging enthusiasm throughout this project.

- Mechanisms of Change
- The Sociocultural Context
- Individual Differences
- Research and Children's Welfare

In 1955, a group of child-development researchers began a unique study. Their goal, like that of many developmental researchers, was to find out how biological and environmental factors influence children's intellectual, social, and emotional growth. What made their study unique was that they examined these diverse aspects of development for all 698 children born that year on the Hawaiian island of Kauai and continued studying the children's development for more than 30 years.

With the parents' consent, the research team, headed by Emmy Werner, collected many types of data about the children. To learn about possible complications during the prenatal period and birth, they examined physicians' records. To learn about family interactions and the children's behavior at home, they arranged for nurses and social workers to observe the families and to interview the children's mothers when the children were 1 year old and again when they were 10 years old. The researchers also interviewed teachers about the children's academic performance and classroom behavior during the elementary school years and examined police, family court, and social service records that involved the children, either as victims or perpetrators. Finally, the researchers administered standardized intelligence and personality tests to the participants when they were 10 and 18 years old and interviewed them at age 18 and again in their early 30s to find out how they saw their own development.

Results from this study illustrated some of the many ways in which biological and environmental factors combine to produce child development. For example, children who experienced prenatal or birth complications were more likely than others to develop physical handicaps, mental illness, and learning difficulties. But whether they developed such problems—and if so, to what degree—depended a great deal on their home environment. Parents' income, education, and mental health, together with the quality of the relationship between the parents, especially influenced children's development. By age 2, toddlers who had experienced severe prenatal or birth problems but who lived in harmonious middle-income families were nearly as advanced in language and motor skills as were children who had not experienced such problems. By the time the children were 10-year-olds, prenatal and birth problems were consistently related to psychological difficulties *only* if the children also grew up in poor rearing conditions.

What of children who faced both biological and environmental challenges—prenatal or birth complications *and* adverse family circumstances? The majority of these children developed serious learning or behavior problems by age 10. By age 18, most had acquired a police record, had experienced mental health problems, or had become an unmarried parent. However, one-third of such at-risk children showed impressive resilience, growing up into young adults who, in the words of Werner (1989, p. 108D), “loved well, worked well, and played well.”

Michael was one such resilient child. Born prematurely, with low birth weight, to teenage parents, he spent the first 3 weeks of his life in a hospital, separated from his mother. By his 8th birthday, Michael's parents were divorced, his mother had deserted the family, and he and his three brothers and sisters were being raised by their father, with the help of their elderly grandparents. Yet by age 18, Michael was successful in school, had high self-esteem, was popular with his peers, and was a caring young man with a positive attitude toward life. The fact that there are many children like Michael—children who show great resilience in the face of adversity—is among the most heartening findings of research on

child development. Learning about the Michaels of the world inspires child development researchers to conduct further investigations aimed at answering such questions as why individual children differ so much in their response to similar environments, and how to apply research findings to help more children overcome the challenges they face.

Reading this chapter will increase your understanding of these and other basic questions about child development. It also will introduce you to some historical perspectives on these fundamental questions and to the perspectives and methods that modern researchers use to address them. But first, we would like you to consider perhaps the most basic question of all: Why study child development?

Reasons to Learn About Child Development

For us, as both parents and researchers, the sheer enjoyment of watching children and trying to understand them is reason enough for studying child development. What could be more fascinating than the development of a child? But there are also practical and intellectual reasons for studying child development. Understanding how children develop can improve child-rearing, promote the adoption of wiser social policies regarding children's welfare, and answer intriguing questions about human nature. We examine each of these reasons in the following sections.

Raising Children

Being a good parent is not easy. Among its many challenges are the endless questions it raises over the years. Is it okay to take my infant outside in the cold weather? Should my baby stay at home, or would going to day care be better for his social development? If my daughter starts walking and talking early, should I consider placing her in a school for gifted children? Should I try to teach my 3-year-old to read early? My son seems so lonely at preschool; how can I help him make friends? How can I help my kindergartner deal with her anger?

Child-development research can help answer such questions. For example, one problem that confronts almost all parents is how to help their children control their anger and other negative emotions. One tempting, and frequent, reaction is to spank children who express anger in inappropriate ways, such as fighting, name-calling, and talking back. In a study involving a representative U.S. sample, 80% of parents of kindergarten children reported having spanked their child on occasion, and 27% reported having spanked their child the previous week (Gershoff et al., 2012). In fact, spanking made the problem worse. The more often parents spanked their kindergartners, the more often the same children argued, fought, and acted inappropriately at school when they were 3rd-graders. This relation held true for Blacks, Whites, Hispanics, and Asians alike, and it held true above and beyond the effects of other relevant factors, such as parents' income and education.

Fortunately, research suggests several effective alternatives to spanking (Denham, 1998, 2006). One is expressing sympathy: when parents respond to their

ROBERT NICKELSBURG / GETTY IMAGES

Will these children be resilient enough to overcome their disadvantaged environment? The answer will depend in large part on how many risk factors they face and on their personal characteristics.

Posters like this are used in the turtle technique to remind children of ways to control anger.

children's distress with sympathy, the children are better able to cope with the situation causing the distress. Another effective approach is helping angry children find positive alternatives to expressing anger. For example, encouraging them to do something they enjoy helps them cope with the hostile feelings.

These strategies and similar ones, such as time-outs, can also be used effectively by others who contribute to raising children, such as day-care personnel and teachers. One demonstration of this was provided by a special curriculum that was devised for helping preschoolers (3- and 4-year-olds) who were angry and out of control (Denham & Burton, 1996). With this curriculum, preschool teachers helped children recognize their own and other children's emotions, taught them techniques for controlling their anger, and guided them in resolving conflicts with other children. One approach that children were taught for coping with anger was the "turtle technique." When children felt themselves becoming angry, they were to move away from other children and retreat into

their "turtle shell," where they could think through the situation until they were ready to emerge from the shell. Posters were placed around the classroom to remind children of what to do when they became angry.

The curriculum was quite successful. Children who participated in it became more skillful in recognizing and regulating anger when they experienced it and were generally less negative. For example, one boy, who had regularly gotten into fights when angry, told the teacher after a dispute with another child, "See, I used my words, not my hands" (Denham, 1998, p. 219). The benefits of this program can be long-term. In one test conducted with children in special education classrooms, positive effects were still evident 2 years after children completed the curriculum (Greenberg & Kusché, 2006). As this example suggests, knowledge of child-development research can be helpful to everyone involved in the care of children.

Choosing Social Policies

Another reason to learn about child development is to be able to make informed decisions not just about one's own children but also about a wide variety of social-policy questions that affect children in general. For example, how much trust should judges and juries place in preschoolers' testimony in child-abuse cases? Should children who do poorly in school be held back, or should they be promoted to the next grade so that they can be with children of the same age? How effective are health-education courses aimed at reducing teenage smoking, drinking, and pregnancy? Child-development research can inform discussion of all of these policy decisions and many others.

Consider the issue of how much trust to put in preschoolers' courtroom testimony. At present, more than 100,000 children testify in legal cases each year (Bruck, Ceci, & Principe, 2006). Many of these children are very young: more than 40% of children who testify in sexual-abuse trials, for example, are younger than 5 years, and almost 40% of substantiated sexual-abuse cases involve children younger than age 7 (Bruck et al., 2006; Gray, 1993). The stakes are extremely high in such cases. If juries believe children who falsely testify that they were abused, innocent people may spend years in jail. If juries do not believe children who accurately

report abuse, the perpetrators will go free and probably abuse other children. So what can be done to promote reliable testimony from young children and to avoid leading them to report experiences that never occurred?

Psychological research has helped answer such questions. In one experiment, researchers tested whether biased questioning affects the accuracy of young children's memory for events involving touching one's own and other people's bodies. The researchers began by having 3- to 6-year-olds play a game, similar to "Simon Says," in which the children were told to touch various parts of their body and those of other children. A month later, the researchers had a social worker interview the children about their experiences during the game (Ceci & Bruck, 1998). Before the social worker conducted the interviews, she was given a description of each child's experiences. Unknown to her, the description included inaccurate as well as accurate information. For example, she might have been told that a particular child had touched her own stomach and another child's nose, when in fact the child had touched her own stomach and the other child's foot. After receiving the description, the social worker was given instructions much like those in a court case: "Find out what the child remembers."

As it turned out, the version of events that the social worker had heard often influenced her questions. If, for example, a child's account of an event was contrary to what the social worker believed to be the case, she tended to question the child repeatedly about the event ("Are you sure you touched his foot? Is it possible you touched some other part of his body?"). Faced with such repeated questioning, children fairly often changed their responses, with 34% of 3- and 4-year-olds eventually corroborating at least one of the social worker's incorrect beliefs. Children were led to "remember" not only plausible events that never happened but also unlikely ones that the social worker had been told about. For example, some children "recalled" their knee being licked and a marble being inserted in their ear.

Studies such as this have yielded a number of conclusions regarding children's testimony in legal proceedings. One important finding is that when 3- to 5-year-olds are not asked leading questions, their testimony is usually accurate, as far as it goes (Bruck et al., 2006; Howe & Courage, 1997). However, when prompted by leading questions, young children's testimony is often inaccurate, especially when the leading questions are asked repeatedly. The younger children are, the more susceptible they are to being led, and the more their recall reflects the biases of the interviewer's questions. In addition, realistic props, such as anatomically correct dolls and drawings, that are often used in judicial cases in the hopes of improving recall of sexual abuse, do not improve recall of events that occurred; they actually increase the number of inaccurate claims, perhaps by blurring the line between fantasy play and reality (Lamb et al., 2008; Poole, Bruck, & Pipe, 2011). Research on child eyewitness testimony has had a large practical impact, leading many judicial and police agencies to revise their procedures for interviewing child witnesses to incorporate the lessons of this research (e.g., State of Michigan, Governor's Task Force, 2005). In addition to helping courts obtain more accurate testimony from young children, such research-based conclusions illustrate how, at a broader level, knowledge of child development can inform social policies.

ST. PETERSBURG TIMES / SCOTT MCINTYRE / THE IMAGE WORKS

In courtrooms such as this one, asking questions that will help children to testify accurately is of the utmost importance.

Understanding Human Nature

A third reason to study child development is to better understand human nature. Many of the most intriguing questions regarding human nature concern children. For example, does learning start only after children are born, or can it occur in the womb? Can later upbringing in a loving home overcome the detrimental effects of early rearing in a loveless institutional setting? Do children vary in personality and intellect from the day they are born, or are they similar at birth, with differences arising only because they have different experiences? Until recently, people could only speculate about the answers to such questions. Now, however, developmental scientists have methods that enable them to observe, describe, and explain the process of development.

A particularly poignant illustration of the way in which scientific research can increase understanding of human nature comes from studies of how children's ability to overcome the effects of early maltreatment is affected by its timing, that is, the age at which the maltreatment occurs. One such research program has examined children whose early life was spent in horribly inadequate orphanages in Romania in the late 1980s and early 1990s (McCall et al., 2011; Nelson et al., 2007; Rutter et al., 2004). Children in these orphanages had almost no contact with any caregiver. For reasons that remain unknown, the brutal Communist dictatorship of that era instructed staff workers not to interact with the children, even when giving them their bottles. Staff members provided the infants with so little physical contact that the crown of many infants' heads became flattened from the babies' lying on their backs for 18 to 20 hours per day.

Shortly after the collapse of Communist rule in Romania, a number of these children were adopted by families in Great Britain. When these children arrived in Britain, most were severely malnourished, with more than half being in the lowest 3% of children their age in terms of height, weight, and head circumference. Most also showed varying degrees of mental retardation and were socially immature. The parents who adopted them knew of their deprived backgrounds and were highly motivated to provide loving homes that would help the children overcome the damaging effects of their early mistreatment.

To evaluate the long-term effects of their early deprivation, the physical, intellectual, and social development of about 150 of the Romanian-born children was examined at age 6 years. To provide a basis of comparison, the researchers also followed the development of a group of British-born children who had been adopted into British families before they were 6 months of age. Simply put, the question was whether human nature is sufficiently flexible that the Romanian-born children could overcome the extreme deprivation of their early experience, and if so, would that flexibility decrease with the children's age and the length of the deprivation.

By age 6, the physical development of the Romanian-born children had improved considerably, both in absolute terms and in relation to the British-born comparison group. However, the Romanian children's early experience of deprivation continued to influence their development, with the extent of negative effects depending on how long the children had been institutionalized. Romanian-born children who were adopted by British families before age 6 months, and who had therefore spent the smallest portion of their early lives in the orphanages, weighed about the same as British-born children when both were 6-year-olds. Romanian-born children adopted between the ages of 6 and 24 months, and who therefore had

PETER TURNLEY / CORBIS

This infant is one of the children adopted from a Romanian orphanage in the 1990s. How successfully he develops will depend not only on the quality of caregiving he receives in his adoptive home but also on the amount of time he spent in the orphanage and the age at which he was adopted.

spent more of their early lives in the orphanages, weighed less; and those adopted between the ages of 24 and 42 months weighed even less (Rutter et al., 2004).

Intellectual development at age 6 years showed a similar pattern. The Romanian-born children who had been adopted before age 6 months demonstrated levels of intellectual competence comparable with those of the British-born group. Those who had been adopted between ages 6 and 24 months did somewhat less well, and those adopted between ages 24 and 42 months did even more poorly (Rutter et al., 2004). The intellectual deficits of the Romanian children adopted after age 6 months were just as great when the children were retested at age 11, indicating that the negative effects of the early deprivation persisted over time (Beckett et al., 2006; Kreppner et al., 2007).

The early experience in the orphanages had similar damaging effects on the children's social development (Kreppner et al., 2007; O'Connor, Rutter, & English and Romanian Adoptees Study Team, 2000). Almost 20% of the Romanian-born children who were adopted after age 6 months showed extremely abnormal social behavior at age 6 years, not looking at their parents in anxiety-provoking situations and willingly going off with strangers (versus 3% of the British-born comparison group who did so). This atypical social development was accompanied by abnormal brain activity. Brain scans obtained when the children were 8 years old showed that those adopted after living for a substantial period in the orphanages had unusually low levels of neural activity in the amygdala, a brain area involved in emotional reactions (Chugani et al., 2001). Subsequent studies have identified similar brain abnormalities among children who spent their early lives in poor-quality orphanages in Russia and East Asia as well (Nelson et al., 2011; Tottenham et al., 2010).

These findings reflect a basic principle of child development that is relevant to many aspects of human nature: *The timing of experiences influences their effects.* In the present case, children were sufficiently flexible to overcome the effects of living in the loveless, unstimulating institutions if the deprivation ended relatively early; living in the institutions until older ages, however, had effects that were rarely overcome, even when children spent subsequent years in loving and stimulating environments. The adoptive families clearly made a huge positive difference in their children's lives, but the later the age of adoption, the greater the long-term effects of early deprivation.

review:

There are at least three good reasons to learn about child development: to improve one's own child-rearing, to help society promote the well-being of children in general, and to better understand human nature.

Historical Foundations of the Study of Child Development

From ancient Greece to the early years of the twentieth century, a number of profound thinkers observed and wrote about children. Their goals were like those of contemporary researchers: to help people become better parents, to improve children's well-being, and to understand human nature. Unlike contemporary researchers, they usually based their conclusions on general philosophical beliefs and informal observations of a few children. Still, the issues they raised are sufficiently important, and their insights sufficiently deep, that their views continue to be of interest.

Early Philosophers' Views of Children's Development

Some of the earliest recorded ideas about children's development were those of Plato and Aristotle. These classic Greek philosophers, who lived in the fourth century B.C.E., were particularly interested in how children's development is influenced by their nature and by the nurture they receive.

Both Plato and Aristotle believed that the long-term welfare of society depended on the proper raising of children. Careful upbringing was essential because children's basic nature would otherwise lead to their becoming rebellious and unruly. Plato viewed the rearing of boys as a particularly demanding challenge for parents and teachers:

Now of all wild things, a boy is the most difficult to handle. Just because he more than any other has a fount of intelligence in him which has not yet "run clear," he is the craftiest, most mischievous, and unruliest of brutes.

(*Laws*, bk. 7, p. 808)

Consistent with this view, Plato emphasized self-control and discipline as the most important goals of education (Borstelmann, 1983).

Aristotle agreed with Plato that discipline was necessary, but he was more concerned with fitting child-rearing to the needs of the individual child. In his words:

It would seem . . . that a study of individual character is the best way of making education perfect, for then each [child] has a better chance of receiving the treatment that suits him.

(*Nicomachean Ethics*, bk. 10, chap. 9, p. 1180)

Plato and Aristotle differed more profoundly in their views of how children acquire knowledge. Plato believed that children have innate knowledge. For example, he believed that children are born with a concept of "animal" that, from birth onward, automatically allows them to recognize that the dogs, cats, and other creatures they encounter are animals. In contrast, Aristotle believed that all knowledge comes from experience and that the mind of an infant is like a blackboard on which nothing has yet been written.

Roughly 2000 years later, the English philosopher John Locke (1632–1704) and the French philosopher Jean-Jacques Rousseau (1712–1778) refocused attention on the question of how parents and society in general can best promote children's development. Locke, like Aristotle, viewed the child as a *tabula rasa*, or blank slate, whose development largely reflects the nurture provided by the child's parents and the broader society. He believed that the most important goal of child-rearing is the growth of character. To build children's character, parents need to set good examples of honesty, stability, and gentleness. They also need to avoid indulging the child, especially early in life. However, once discipline and reason have been instilled, Locke believed,

authority should be relaxed as fast as their age, discretion, and good behavior could allow it. . . . The sooner you treat him as a man, the sooner he will begin to be one.

(Cited in Borstelmann, 1983, p. 20)

In contrast to Locke's advocating discipline before freedom, Rousseau believed that parents and society should give children maximum freedom from the beginning. Rousseau claimed that children learn primarily from their own spontaneous interactions with objects and other people, rather than through instruction by parents or teachers. He even argued that children should not receive any formal education until about age 12, when they reach "the age of reason" and can judge for

themselves the worth of what they are told. Before then, they should be allowed the freedom to explore whatever interests them.

Although formulated long ago, these and other philosophical positions continue to underlie many contemporary debates, including whether children should receive direct instruction in desired skills and knowledge or be given maximum freedom to discover the skills and knowledge for themselves, and whether parents should build their children's character through explicit instruction or through the implicit guidance provided by the parents' own behavior.

Social Reform Movements

Another precursor of the contemporary field of child psychology was early social reform movements that were devoted to improving children's lives by changing the conditions in which they lived. During the Industrial Revolution of the eighteenth and nineteenth centuries, a great many children in Europe and the United States worked as poorly paid laborers with no legal protections. Some were as young as 5 and 6 years; many worked up to 12 hours a day in factories or mines, often in extremely hazardous circumstances. These harsh conditions worried a number of social reformers, who began to study how such circumstances affected the children's development. For example, in a speech before the British House of Commons in 1843, the Earl of Shaftesbury noted that the narrow tunnels where children dug out coal had

very insufficient drainage [and] are so low that only little boys can work in them, which they do naked, and often in mud and water, dragging sledge-tubs by the girdle and chain. . . . Children of amiable temper and conduct, at 7 years of age, often return next season from the collieries greatly corrupted . . . with most hellish dispositions.

(Quoted in Kessen, 1965, pp. 46–50)

The Earl of Shaftesbury's effort at social reform brought partial success—a law forbidding employment of girls and of boys younger than 10. In addition to bringing about the first child labor laws, this and other early social reform movements established a legacy of research conducted for the benefit of children and provided some of the earliest recorded descriptions of the adverse effects that harsh environments can have on children.

Darwin's Theory of Evolution

Later in the nineteenth century, Charles Darwin's work on evolution inspired a number of scientists to propose that intensive study of children's development might lead to important insights into human nature. Darwin himself was interested in child development and in 1877 published an article entitled "A Biographical Sketch of an Infant," which presented his careful observations of the motor, sensory, and emotional growth of his infant son, William. Darwin's "baby biography"—a systematic description of William's day-to-day development—represented one of the first methods for studying children.

Such intensive studies of individual children's growth continue to be a distinctive feature of the modern field of child development. Darwin's evolutionary theory also continues to influence the thinking of modern developmentalists on a wide

During the eighteenth, nineteenth, and early twentieth centuries, many young children worked in coal mines and factories. Their hours were long, and the work was often unhealthy and dangerous. Concern over the well-being of such children led to some of the earliest research on child development.
