# Dietary Reference Intakes (DRIs)

The Dietary Reference Intakes (DRIs) include two sets of values that serve as goals for nutrient intake—Recommended Dietary Allowances (RDAs) and Adequate Intakes (AIs). The RDA reflects the average daily amount of a nutrient considered adequate to meet the needs of most healthy people. If there is insufficient evidence to determine an RDA, an AI is set. The DRIs also include a set of values called Tolerable Upper Intake Levels (ULs). The UL represents the maximum amount of a nutrient that appears safe for most healthy people to consume on a regular basis. Turn the page for a listing of the ULs for selected vitamins and minerals and the Acceptable Macronutrient Distribution Range (AMDR) values.

## Estimated Energy Requirements (EERs), Recommended Dietary Allowances (RDAs), and Adequate Intakes (AIs) for Water, Energy, and the Macronutrients

Life-Stage Group	Reference BMI (kg/m <sup>2</sup> )	Reference height, cm (in)	Reference weight, kg (lb)	Water <sup>a</sup> AI (L/day)	Energy EER <sup>b</sup> (kcal/day)	Carbohydrate RDA (g/day)	Total fiber AI (g/day)	Total fat AI (g/day)	Linoleic acid AI (g/day)	Linolenic acid <sup>c</sup> AI (g/day)	Protein RDA (g/day) <sup>d</sup>	Protein RDA (g/kg/day) <sup>e</sup>
<b>Males</b>												
0–6 mo	—	62 (24)	6 (13)	0.7 <sup>e</sup>	570	60	—	31	4.4	0.5	9.1	1.52

1–3 y <sup>g</sup>	—	86 (34)	12 (27)	1.3	992	130	19	—	7	0.7	13	1.05
4–8 y <sup>g</sup>	15.3	115 (45)	20 (44)	1.7	1642	130	25	—	10	0.9	19	0.95
9–13 y	17.4	144 (57)	37 (81)	2.1	2071	130	26	—	10	1.0	34	0.95
14–18 y	20.4	163 (64)	54 (119)	2.3	2368	130	26	—	11	1.1	46	0.85
19–30 y	21.5	163 (64)	57 (126)	2.7	2403 <sup>j</sup>	130	25	—	12	1.1	46	0.8
31–50 y	21.5 <sup>i</sup>	163 (64) <sup>i</sup>	57 (126) <sup>i</sup>	2.7	2403 <sup>j</sup>	130	25	—	12	1.1	46	0.8
≥51 y	21.5 <sup>i</sup>	163 (64) <sup>i</sup>	57 (126) <sup>i</sup>	2.7	2403 <sup>j</sup>	130	21	—	11	1.1	46	0.8
<b>Pregnancy</b>												
14–18 y				3.0	+0	175	28	—	13	1.4	71	1.1
19–30 y				3.0	+340	175	28	—	13	1.4	71	1.1
31–50 y				3.0	+452	175	28	—	13	1.4	71	1.1
<b>Lactation</b>												
1st 6 months postpartum				3.8	+330	210	29	—	13	1.3	71	1.3
2nd 6 months postpartum				3.8	+400	210	29	—	13	1.3	71	1.3

Note: For all nutrients, values for infants are AIs. Dashes indicate that values have not been determined.

<sup>a</sup>The water AI includes drinking water, water in beverages, and water in foods; in general, drinking water and other beverages contribute about 70 to 80%, and foods, the remainder. Conversion factors: 1 L = 33.8 fluid oz; 1 L = 1.06 qt; 1 cup = 8 fluid oz.

<sup>b</sup>The Estimated Energy Requirement (EER) represents the average dietary energy intake that will maintain neutral energy balance in a healthy person of a given sex, age, weight, height, and physical activity level. The values listed are based on an “active” person at the reference height and weight and at the midpoint ages for each group until age 19. Chapter 2 and Appendix B provide equations and tables to determine Estimated Energy Requirements.

<sup>c</sup>The linolenic acid referred to in this table and text is the omega-3 fatty acid known as alpha-linolenic acid.

<sup>d</sup>The values listed are based on reference body weights.

<sup>e</sup>Assumed to be from human milk.

<sup>f</sup>Assumed to be from human milk and complementary foods and beverages. This includes approximately 0.6 L (~3 cups) as total fluid including formula, juices, and drinking water.

<sup>g</sup>For energy, the age groups for young children are 1–2 years and 3–8 years.

<sup>h</sup>For males, subtract 10 kilocalories per day for each year of age above 19.

<sup>i</sup>Because weight need not change as adults age if activity is maintained, reference weights for adults 19 through 30 are applied to all adult age groups.

<sup>j</sup>For females, subtract 7 kilocalories per day for each year of age above 19.

14–18 y	2300	3600	3000	4000	350	45	34	900	400	8000	9	10	1700	17	1.0
19–50 y	2300	3600	2500	4000	350	45	40	1100	400	10,000	11	10	2000	20	1.0

<sup>d</sup>The UL for magnesium applies to synthetic forms obtained from supplements or drugs only.

<sup>e</sup>Source of intake should be from human milk (or formula) and food only.

<sup>f</sup>The UL for calcium for 19–50 y is 2500 mg; the UL for calcium is reduced to 2000 mg for 51–70 y.

Note: An Upper Limit was not established for vitamins and minerals not listed and for those age groups listed with a dash (—) because of a lack of data, not because these nutrients are safe to consume at any level of intake. All nutrients can have adverse effects when intakes are excessive.

## Acceptable Macronutrient Distribution Ranges (AMDRs)

Macronutrient	Range (percent of energy)		
	Children, 1–3 years	Children, 4–18 years	Adults 19+ years
Fat	30–40	25–35	20–35
ω-6 polyunsaturated acids <sup>a</sup> (linoleic acid)	5–10	5–10	5–10
ω-3 polyunsaturated fatty acids <sup>a</sup> (linolenic acid)	0.6–1.2	0.6–1.2	0.6–1.2
Carbohydrate	45–65	45–65	45–65
Protein	5–20	10–30	10–35

<sup>a</sup>Approximately 10% of the total can come from longer-chain ω-3 or ω-6 fatty acids.

# CONTENTS IN BRIEF

- CHAPTER 1** The Science of Nutrition 3
- CHAPTER 2** Nutritional Assessment and Dietary Planning 31
- CHAPTER 3** Chemical, Biological, and Physiological Aspects of Nutrition 69
- CHAPTER 4** Carbohydrates 113  
**Nutrition Matters** Nutrition and Diabetes 147
- CHAPTER 5** Protein 161  
**Nutrition Matters** Food Safety 199
- CHAPTER 6** Lipids 217  
**Nutrition Matters** Nutrition and Cardiovascular Health 254
- CHAPTER 7** Energy Metabolism 269  
**Nutrition Matters** Alcohol, Health, and Disease 301
- CHAPTER 8** Energy Balance and Body Weight Regulation 321  
**Nutrition Matters** Disordered Eating 365
- CHAPTER 9** Physical Activity and Health 385
- CHAPTER 10** Water-Soluble Vitamins 417
- CHAPTER 11** Fat-Soluble Vitamins 459  
**Nutrition Matters** Nutrition and Cancer 489
- CHAPTER 12** The Major Minerals and Water 505  
**Nutrition Matters** Nutrition and Bone Health 540
- CHAPTER 13** The Trace Minerals 553
- CHAPTER 14** Life Cycle Nutrition 583  
**Nutrition Matters** Food Security, Hunger, and Malnutrition 634

## APPENDIXES

- A** Aids to Calculation A-2
- B** Estimated Energy Requirement (EER) Calculations and Physical Activity Values (PA) A-4
- C** Summary of the 2010 Dietary Guidelines for Americans A-6
- D** The Exchange System A-7
- E** Answers to Study Card Review Questions A-22

**Glossary** G-1

**Index** I-1

# CONTENTS

## CHAPTER 1 The Science of Nutrition 3

- Everybody Has a Story** Choosing Nutrition as a Career Path 4
- What Do We Mean by “Nutrition”? 5
- Nutrients Support All We Do 5 • Foods Contain Nutrients and Nonnutrients 5 • Organic Nutrients Are Different from Organic Foods 6
- Focus on Food** Understanding What Is Meant by “Organic Foods” 7
- Phytochemicals, Zoonutrients, and Functional Foods 7
- What Are the Major Nutrient Classes? 8
- Carbohydrates Are Vital for Energy and Regulatory Roles 8 • Proteins Make Up Muscles and Are Important for Energy and Regulation 9 • Lipids Are More Than Abundant Energy Sources 9 • Water Is the Essence of Life Itself 9 • Vitamins Regulate Reactions and Promote Growth and Development 9 • Minerals Provide Structure and Assist with Regulation 10
- How Do Foods Provide Energy? 10
- Energy in Food Is Measured in Units Called Calories 11
- How Is Nutrition Research Conducted? 13
- Step 1: The Observation Must Be Accurate 13 • Step 2: A Hypothesis Makes Sense of an Observation 13 • Step 3: Data Are Collected to Test the Hypothesis 15 • Intervention Studies Test for Causality 16
- Are All Nutrition Claims Believable? 19
- Determine the Source of the Information 20 • Credibility of the Researchers Is Important 21 • Who Paid for the Research? 21 • Evaluate the Experimental Design 21 • Do Public Health Organizations Concur? 21
- Nutrition and Health: What Is the Connection? 22
- Public Health Agencies Assess the Health of the Nation 22 • Mortality and Morbidity Rates Measure Death and Illness Over Time 22 • Life Expectancy Has Increased Dramatically 23 • Diseases Are Either Infectious or Noninfectious 24 • Chronic Diseases Are the Leading Causes of Death 24 • Risk Factors Do Not Necessarily Cause Chronic Diseases 26 • Understanding Nutrition Is More Important Than Ever 26
- Focus on Diet and Health** Industrialization, Population Growth, and the Nutrition Transition 27

## CHAPTER 2 Nutritional Assessment and Dietary Planning 31

- Everybody Has a Story** Nutrient Deficiencies—Primary or Secondary? 32
- What Do We Mean by “Nutritional Status”? 33
- Primary and Secondary Malnutrition Can Lead to Poor Nutritional Status 33 • Adequate Nutrient Intake Can Be Different Among Individuals 34
- How Is Nutritional Status Assessed? 34
- Anthropometry: Body Measurements Provide Information Concerning Nutritional Status 34 • Laboratory Tests Are Important Biochemical Indicators of Nutritional Status 35 • Clinical Evaluations Assess Signs and Symptoms of Disease 36 • Analysis of Your Diet Can Also Be Helpful 36 • Food Composition Tables and Dietary Analysis Software Are Important Tools 37
- How Much of a Nutrient Is Adequate? 38
- Dietary Reference Intakes (DRIs) Provide Reference Standards 38 • DRI Values Depend on Many Factors 40 • Estimated Average Requirements (EARs) Reflect a *Population’s* Average Need 41 • Recommended Dietary Allowances (RDAs) Are Recommended Intake Goals for *Individuals* 42 • Adequate Intake (AI) Levels Were Set When Data Were Lacking for EARs 43 • Tolerable Upper Intake Levels (ULs) Reflect Safe Maximal Intakes 43 • Energy Intake Can Also Be Evaluated 44
- How Can You Easily Assess and Plan Your Diet? 46
- Food Guidance Systems Have Been Part of Dietary Planning for Decades 47
- 2010 Dietary Guidelines for Americans: Our Current Recommendations 48
- Balance Calories to Manage Weight 49 • Reduce Certain Foods and Food Components 50 • Increase Certain Foods and Nutrients 50
- Food Matters** Working Toward the Goal: Maximizing Nutrient Intake by Increasing Fruit and Vegetable Intake 51
- Build Healthy Eating Patterns 51 • Helping Americans Make Healthy Choices 53 • MyPlate Illustrates How to Put Recommendations into Practice 54 • Healthy People 2020 Outlines Our Nation’s Goals for Healthy Living 56
- How Can You Use Food Labels to Plan a Healthy Diet? 58
- Understanding Nutrition Facts Panels 58

**Focus on Food** What Makes a Food Kosher? 60  
**Focus on Food** The *Buy Fresh Buy Local* Campaign 62  
Nutrient Content Claims, Structure/Function  
Claims, and Health Claims 63

Can You Put These Concepts into Action? 64

Step 1: Set the Stage and Set Your Goals 64 • Step 2:  
Assess Your Nutritional Status 64 • Step 3: Set the  
Table to Meet Your Goals 65 • Step 4: Compare Your Plan  
with Your Assessment: Did You Succeed? 65 • There Is No  
Time Like the Present 66

## CHAPTER 3 Chemical, Biological, and Physiological Aspects of Nutrition 69

**Everybody Has a Story** Living with Crohn's Disease 70

How Does Chemistry Apply to the Study of Nutrition? 71

Atoms Are Fundamental Units of Matter That Make  
Up the World Around Us 72 • Chemical Bonds Enable  
Atoms to Form Millions of Different Molecules 73 •  
Complex Molecules Are Vital to Cell Function 74 •  
Acid-Base Chemistry Is Important to the Study  
of Nutrition 75

How Do Biological Molecules Form Cells, Tissues,  
Organs, and Organ Systems? 76

Substances Cross Cell Membranes by Passive  
and Active Transport 76 • Cell Organelles Carry Out  
Specialized Functions Critical for Life 78 • Groups  
of Cells Make Up Tissues, Tissues Make Up Organs,  
and Organs Make Up Organ Systems 79

How Does the Digestive System Break Down Food  
into Absorbable Components? 81

The GI Tract Has Four Tissue Layers That Contribute  
to the Process of Digestion 81

How Do Gastrointestinal Motility  
and Secretions Facilitate Digestion? 84

Gastrointestinal (GI) Motility Mixes and Propels Food  
in the GI Tract 85 • Gastrointestinal (GI) Secretions  
Aid Digestion and Protect the GI Tract 86 • Neural  
and Hormonal Signals Regulate Gastrointestinal Motility  
and Secretions 86

How Does the Gastrointestinal Tract Coordinate  
Functions to Optimize Digestion and Nutrient  
Absorption? 88

Digestion Begins in the Mouth with Chewing  
and Mixing Food 88 • The Esophagus Delivers Food

to the Stomach 90 • Functions of the Stomach Include  
Storage, Release of Gastric Secretions, and Mixing 90

**Focus on Clinical Applications** Peptic Ulcers and  
Gastroesophageal Reflux Disease 95

The Small Intestine Is the Primary Site of Chemical Digestion  
and Nutrient Absorption 96

How Does the Body Circulate Nutrients  
and Eliminate Cellular Waste Products? 101

Nutrients Absorbed from the Small Intestine  
Are Circulated to the Liver 101 • The Cardiovascular  
System Circulates Nutrients, Oxygen, and Other  
Substances 101

**Focus on Clinical Applications** Celiac Disease 102

The Lymphatic System Transports Fat-Soluble Nutrients  
Away from the GI Tract 104 • The Kidneys Play an  
Important Role in Excreting Cellular Waste Products 104

What Is the Role of the Large Intestine? 106

The Large Intestine Aids in the Elimination of Solid  
Waste Products 106

**Focus on Clinical Applications** Cranberry Juice  
and Urinary Tract Infections 107

Fluids and Electrolytes Are Absorbed and Reabsorbed  
in the Large Intestine 108 • Microbial Action in the Large  
Intestine Breaks Down Undigested Food Residue 108

**Focus on Clinical Applications** Irritable Bowel Syndrome  
and Inflammatory Bowel Disease 109

The Large Intestine Stores and Eliminates Solid Waste  
Products from the Body 109

**Focus on Clinical Applications**  
Probiotic and Prebiotic Foods 110

## CHAPTER 4 Carbohydrates 113

**Everybody Has a Story** What It Takes to Stay in the Race 114

What Are Simple Carbohydrates? 115

Monosaccharides Are Single Sugar Molecules 115

**Focus on Diet and Health** Is High-Fructose Corn  
Syrup Contributing to the Obesity Epidemic? 118

Disaccharides Consist of Two Monosaccharides 119

What Are Complex Carbohydrates? 121

Oligosaccharides Are Components of Cell Membranes 121

**Focus on Food** Are Nonsugar Sweeteners Beneficial  
to Health? 122

Polysaccharides Differ in the Types and Arrangements  
of Sugar Molecules 123

How Are Carbohydrates Digested, Absorbed,  
and Circulated in the Body? 129

Starch Digestion Begins in the Mouth 130 •

Disaccharides Are Digested in the Small

Intestine 130 • Monosaccharides Are Readily Absorbed

from the Small Intestine 133 • Monosaccharides Have Several Functions in the Body 134

### How Do Hormones Regulate Blood Glucose and Energy Storage? 135

The Hormones Insulin and Glucagon Are Produced by the Pancreas 136 • Insulin Lowers Blood Glucose and Promotes Energy Storage 137 • Glucagon Helps Increase Blood Glucose 139 • Fight-or-Flight Response Provides an Immediate Energy Source 141 • Ketones Are the Body's Alternative Energy Source 141

### How Much Carbohydrate Do We Require? 142

Dietary Reference Intakes for Carbohydrates 142 • Dietary Guidelines and MyPlate Emphasize Whole Grains, Fruits, and Vegetables 143

**Food Matters** Working Toward the Goal: Focus on Reducing Added Sugars 144

### **Nutrition Matters** Nutrition and Diabetes 147

#### What Is Diabetes? 147

The Discovery of Insulin 147 • Diabetes Is Classified by Its Underlying Cause 147

#### What Is Type 1 Diabetes? 148

Type 1 Diabetes Is Caused by a Lack of Insulin Production 149 • Metabolic Disturbances Result from Type 1 Diabetes 149 • Type 1 Diabetes Requires Insulin Injections or a Pump 150

#### What Is Type 2 Diabetes? 151

Type 2 Diabetes Is Caused by Insulin Resistance 152 • Genetic and Lifestyle Factors Increase the Risk of Developing Type 2 Diabetes 152 • Signs and Symptoms of Type 2 Diabetes Are Often Ignored 153 • Managing Type 2 Diabetes Can Help Prevent Long-Term Complications 154 • Lifestyle Practices Can Influence Risk of Developing Type 2 Diabetes 155

#### What Are Secondary Diabetes and Gestational Diabetes? 155

**Focus on the Process of Science** The Story of the Pima Indians 156

Some Pregnant Women Develop Gestational Diabetes 157

#### Managing Diabetes Today Can Help Prevent Health Problems Tomorrow 157

## CHAPTER 5 Protein 161

**Everybody Has a Story** Living with Peanut Allergy 162

#### What Are Proteins? 163

Amino Acids Are the Building Blocks of Proteins 163 • Amino Acids Are Classified as Essential, Nonessential, or Conditionally Essential 163

#### Are All Food Proteins Equal? 165

Complete and Incomplete Proteins 165 • Protein Complementation 166 • Protein Quality 166

#### How Are Proteins Made? 166

**Focus on Food** Genetically Modified Organisms (GMOs) and Protein Quality 167

Step 1: Cell Signaling Initiates Protein Synthesis 167 •

Step 2: Transcription Transfers Genetic Information to mRNA 168 • Step 3: Translation Produces a New Peptide Chain 169

#### How Do Proteins Get Their Shapes? 169

Primary Structure Dictates a Protein's Basic Identity 169 • Secondary Structure Folds and Twists a Peptide Chain 170 • Tertiary Structure Adds Complexity 170

**Focus on Clinical Applications** Sickle Cell Anemia 171

Some Proteins Have Quaternary Structure and Prosthetic Groups 172 • Denaturing Agents Alter a Protein's Shape and Function 173

#### Genetics, Epigenetics, Nutrition, and Nutrigenomics 174

Genetic Alterations: Mutations and Polymorphisms 174 • Experts Believe That Nutrition May Be Related to Epigenetics 175 • The Human Genome Project Has Opened the Door to Nutrigenomics 175

**Focus on the Process of Science** Personalized Nutrition Based on Genetic Makeup 176

#### How Are Dietary Proteins Digested, Absorbed, and Circulated? 176

Protein Digestion Begins in the Stomach 176 • Protein Digestion Continues in the Small Intestine 177 • Amino Acids Are Absorbed in the Small Intestine and Circulated in the Blood 178

#### What Are the Major Functions of Proteins and Amino Acids in the Body? 179

Proteins Provide Structure 180 • Enzymes Are Proteins That Catalyze Chemical Reactions 181 • Muscle Proteins Facilitate Movement 181 • Some Proteins Provide a Transport Service 181 • Hormones and Cell-Signaling Proteins Are Critical Communicators 182 • Proteins Protect the Body 182 • Fluid Balance Is Regulated in Part by Proteins 182 • Proteins Help Regulate pH 183 • Proteins Are Sources of Glucose and Energy (ATP) 183 • Amino Acids Serve Many Additional Purposes 185

#### Protein Turnover, Urea Excretion, and Nitrogen Balance 185

Protein Turnover Helps Maintain an Adequate Supply of Amino Acids 185 • Nitrogen Is Excreted as Urea 186 • What Is Nitrogen Balance? 186

#### How Much Protein Do You Need? 187

Dietary Reference Intakes (DRIs) for Amino Acids 187 • Dietary Reference Intakes (DRIs) for Proteins 188 • Experts Debate Whether Athletes Need More

Protein 189 • Additional Recommendations for Protein Intake 189

**Focus on Sports Nutrition** Do Protein and Amino Acid Supplements Enhance Athletic Performance? 190

**Food Matters** Working Toward the Goal: Obtaining Sufficient Protein While Minimizing Fats 191

Vegetarian Diets: Healthier Than Other Dietary Patterns? 191

There are Several Forms of Vegetarianism 191 • Vegetarian Diets Sometimes Require Thoughtful Choices 192

What Are the Consequences of Protein Deficiency? 193

Protein Deficiency Is Most Common in Early Life 193 • Protein Deficiency in Adults 194

Protein Excess: Is There Cause for Concern? 194

High Red Meat Consumption May Be Related to Increased Risk for Cancer 194

**Nutrition Matters** Food Safety 199

What Causes Foodborne Illness? 199

Foodborne Illnesses Are Caused by Infectious and Noninfectious Agents 199 • Different Strains of a Microorganism Are Called Serotypes 199 • Some Organisms Make Toxins Before We Eat Them 201 • Some Organisms Make Enteric (Intestinal) Toxins After We Eat Them 202 • Some Organisms Invade Intestinal Cells 203 • Protozoa and Worms Are Types of

Parasites 204 • Prions Are Inert, Nonliving Proteins That May Be Infectious 205

How Can Noninfectious Substances Cause Foodborne Illness? 206

Algae Toxins Can Make Some Fish and Shellfish Poisonous 206 • Some Pesticides, Herbicides, Antibiotics, and Hormones Are Dangerous 206 • Food Allergies and Sensitivities Can Also Cause Foodborne Illness 207 • New Food Safety Concerns Are Always Emerging 207

How Do Food Manufacturers Prevent Contamination? 208

Careful Food-Handling Techniques Help Keep Food Safe 208 • Proper Food Production, Preservation, and Packaging Can Prevent Illness 208

What Steps Can You Take to Reduce Foodborne Illness? 210

Check Consumer Advisory Bulletins 211 • The FightBAC!® Campaign Provides Basic Food Safety Advice 211 • Be Especially Careful When Eating Out 212

What About Avoiding Foodborne Illness While Traveling or Camping? 212

Drink Only Purified or Treated Water 212 • Avoid or Carefully Wash Fresh Fruit and Vegetables 212 • Traveling in Areas with Variant Creutzfeldt-Jakob Disease 213

What Are Some Emerging Issues of Food Biosecurity? 213

## CHAPTER 6 Lipids 217

**Everybody Has a Story** Gallbladder Surgery—When Things Do Not Go Smoothly 218

What Are Lipids? 219

Fats and Oils Are Types of Lipids 219 • Fatty Acids Are the Most Common Type of Lipid 219 • Fatty Acids Are Named for Their Structures 223

**Focus on Diet and Health** Trans Fat-Free Zones 224

Which Fatty Acids Do We Need, and Where Do They Come From? 225

There Are Two Essential Fatty Acids: Linoleic Acid and Linolenic Acid 225 • Some Fatty Acids Are Conditionally Essential 227 • Dietary Sources of Different Types of Fatty Acids 227

**Focus on Life Cycle Nutrition** Optimal Lipid Nutrition during Infancy 228

Mono-, Di-, and Triglycerides: What's the Difference? 229  
Triglycerides Play Many Roles in the Body 229

What Are Phospholipids and Sterols? 231

Phospholipids Are Considered "Amphipathic" 231 • Phospholipids Are Critical for Cell Membranes and Lipid Transport 232 • Sterols and Sterol Esters Are Lipids with Ring Structures 233

How Are Dietary Lipids Digested? 236

Digestion of Triglycerides Requires Bile and Lipases 236

**Focus on Clinical Applications** Gallbladder Disease and Gallstones 239

Digestion of Phospholipids and Cholesteryl Esters Also Requires Pancreatic Enzymes 240

How Are Dietary Lipids Absorbed and Circulated in the Body? 240

Dietary Lipids Are Absorbed in the Small Intestine 241 • Dietary Lipids Are Circulated Away from the Small Intestine in Two Ways 241

What Is the Role of Other Lipoproteins in Lipid Transport and Delivery? 243

Lipoproteins Contain Lipids in Their Cores 243

What Is the Relationship between Lipid Intake and Health? 246

Excess Lipid Intake Can Lead to Obesity 246 • Dietary Lipids May Be Related to Risk of Cardiovascular Disease 246

**Focus on Food** The Skinny on Fat Substitutes 247  
The Relationship between Dietary Lipids and Cancer Is Unclear 248

What Are the Dietary Recommendations for Lipids? 248

Consume Adequate Amounts of the Essential Fatty Acids 248 • Pay Special Attention to the Long-Chain Omega-3 Fatty Acids 248 • Dietary Guidelines and Institute of Medicine Recommend Limiting Saturated Fatty Acids 249

**Food Matters** Working Toward the Goal: Getting the Right Lipids in Your Diet 250

*Trans* Fatty Acids and Cholesterol Should Be Minimized 250 • Guidelines Set for Total Lipid Consumption 250

**Nutrition Matters** Nutrition and Cardiovascular Health 254

How Does Cardiovascular Disease Develop? 254

Atherosclerosis Can Lead to Cardiovascular Disease 254 • Heart Disease Is a Type of Cardiovascular Disease 256 • Stroke Is Another Form of Cardiovascular Disease 257

What Are the Risk Factors for Cardiovascular Disease? 257

Nonmodifiable Risk Factors 258 • Modifiable Risk Factors 258

How Does Nutrition Influence Cardiovascular Risk? 260

Hypertension Can Be Partially Controlled with Diet 260 • Controlling Blood Lipid Levels with Diet 260 • Other Dietary Factors and Patterns Are Associated with Lower Risk 261 • Heart-Healthy Dietary Patterns 263

What Are the General Nutrition Guidelines for Healthy Hearts? 263

Be Mindful of Energy Intake and Macronutrient Balance 263 • Vitamins and Minerals Also Matter 264

## CHAPTER 7 Energy Metabolism 269

**Everybody Has a Story** The Importance of Newborn Screening 270

What Is Energy Metabolism? 271

Metabolic Pathways Consist of Linked Chemical Reactions 271 • Metabolic Pathways Can Be Catabolic or Anabolic 272 • Chemical Reactions Require Enzymes 273 • Energy Metabolism Is Regulated by Changes in ATP Levels 276

What Is the Role of ATP in Energy Metabolism? 276

High-Energy Bonds Enable ATP to Store and Release Energy 277 • ATP Is Synthesized by Substrate Phosphorylation and by Oxidative Phosphorylation 277

How Do Catabolic Pathways Release Stored Energy? 279

Catabolic Pathways Metabolize Glucose for Energy 281 • Catabolic Pathways Can Metabolize Protein for Energy 284 • Triglycerides Are an Important Source of Energy 286

How Do Anabolic Pathways Contribute to Energy Metabolism? 289

Glycogenesis Generates Glycogen from Glucose 290 • Lipogenesis Forms Fatty Acids and Triglycerides 290 • Gluconeogenesis Forms Glucose from Noncarbohydrate Sources 291 • Ketogenesis Plays an Important Role during Times of Limited Glucose Availability 292

**Focus on Diet and Health** Can Ketogenic Diets Help Control Epilepsy? 293

How Is Energy Metabolism Influenced by Feeding and Fasting? 294

The Fed State Favors Energy Storage 294 • Cells Rely on Stored Energy during the Postabsorptive State 294 • Energy Stores Decline during the Fasting State 296

**Focus on Diet and Health** Chronic Caloric Restriction and Longevity 297

The Body Conserves Energy Stores during the State of Prolonged Starvation 298 • Versatile

Solutions Help the Body Meet Its Energy Needs 298

**Focus on the Process of Science** Keys Starvation Experiment 299

**Nutrition Matters** Alcohol, Health, and Disease 301

What Is Alcohol and How Is It Absorbed? 301

Alcohol Is Produced by Fermentation 301 • Several Factors Influence the Rate of Alcohol Absorption 303 • Alcohol Circulates and Accumulates in the Blood 303 • Alcohol Affects the Central Nervous System 303

How Is Alcohol Metabolized? 304

The Alcohol Dehydrogenase (ADH) Pathway Metabolizes the Majority of Alcohol 304 • The Microsomal Ethanol-Oxidizing System (MEOS) Can Also Metabolize Alcohol 306 • Alcohol Metabolism Can Damage the Liver 307 • Alcohol Affects Vitamin A Metabolism in the Liver 308

What Are the Health Benefits Associated with Moderate Alcohol Consumption? 308

Moderate Alcohol Consumption Is Related to Lower Risk of Cardiovascular Disease 308 • Moderate Alcohol Consumption May Provide Other Health Benefits 310

Why Does Heavy Alcohol Consumption Pose Serious Health Risks? 310

Excessive Alcohol Intake Can Impair Nutritional Status 310 • Long-Term Alcohol Abuse Can Lead to Liver Disease 310 • Long-Term Alcohol Abuse Increases Cancer Risk 311 • Alcohol Abuse Can Harm the Cardiovascular System 313 • Alcohol Abuse Can Impair Pancreatic Function 313

How Does Alcohol Abuse Contribute to Individual and Societal Problems? 313

Alcohol Use on College Campuses 314 • Recommendations for Responsible Alcohol Use 315

## CHAPTER 8 Energy Balance and Body Weight Regulation 321

**Everybody Has a Story** The Decision to Have Gastric Bypass Surgery 322

What Is Energy Balance? 323

Energy Balance Affects Body Weight 323

What Determines Energy Intake? 325

Hunger and Satiety Are Physiological Influences on Energy Intake 325

**Focus on Clinical Applications** Bariatric Surgery 327

Appetite Also Affects Energy Intake 329

**Focus on Food** Food Cravings and Food Aversions 330

What Determines Energy Expenditure? 331

Basal Metabolism Accounts for Most of TEE 331 • Physical Activity Is the Second-Largest Component of TEE 333 • Thermic Effect of Food (TEF) Is a Minor Component of TEE 334 • Methods of Assessing Total Energy Expenditure (TEE) 334 • Direct and Indirect Calorimetry Used to Estimate TEE 334 • Stable Isotopes Can Be Used to Estimate TEE 334 • TEE Can Be Estimated Using Mathematical Formulas 335

How Are Body Weight and Body Composition Assessed? 335

Being Overweight Means Having Excess Weight; Being Obese Means Having Excess Fat 335 • Tables Are a Guide to Assessing Body Weight 336 • Clinicians Use Several Techniques to Assess Body Composition 337 • Body Fat Distribution Affects Health 340

How Does Lifestyle Contribute to Obesity? 341

Eating Habits Can Contribute to Obesity 342 • Sedentary Lifestyles Contribute to Weight Gain 344

Can Genetics Influence Body Weight? 345

Identical Twin Studies Help Scientists Understand Role of Genetics 345 • Discovery of the “Obesity Genes” Provides First Genetic Model of Obesity 345

How Does the Body Regulate Energy Balance and Body Weight? 346

Adjusting Energy Intake and Energy Expenditure Maintains Energy Balance 347 • Leptin Communicates

the Body’s Energy Reserve to the Brain 348 • Adiponectin May Provide a Link between Obesity and Weight-Related Diseases 349

What Are the Best Approaches to Weight Loss? 350

Healthy Food Choices Promote Overall Health 350

**Food Matters** Working Toward the Goal: Maintaining a Healthy Body Weight by Balancing Caloric Intake with Energy Expenditure 352

Characteristics of People Who Successfully Lose Weight 353

Does Macronutrient Distribution Matter? 353

**Focus on Food** Eating More and Weighing Less 354

High-Carbohydrate, Low-Fat Weight Loss Diets 355 • Low-Carbohydrate Weight-Loss Diets 356

**Nutrition Matters** Disordered Eating 365

How Do Eating Disorders Differ from Disordered Eating? 365

People with Anorexia Nervosa Pursue Excessive Thinness 366 • People with Bulimia Nervosa Binge and Purge 369 • Most Eating Disorders Are Classified as “Not Otherwise Specified” 371

Are There Other Disordered Eating Behaviors? 372

Some Food-Related Disturbances Involve Nocturnal Eating 372 • Food Neophobia: Avoidance of Trying New Foods 373 • Muscle Dysmorphia: Preoccupation with Muscularity 374

What Causes Eating Disorders? 374

Sociocultural Factors 374 • Family Dynamics 376 • Personality Traits and Emotional Factors Can Trigger Eating Disorders 377 • Biological and Genetic Factors May Also Play a Role in Eating Disorders 377

Are Athletes at Increased Risk for Eating Disorders? 377

Athletics May Foster Eating Disorders in Some People 378 • The Female Athlete Triad 378

How Can Eating Disorders Be Prevented and Treated? 379

Prevention Programs Must Promote a Healthy Body Image 379 • Treatment Strategies Must Focus on Psychological Issues 380

## CHAPTER 9 Physical Activity and Health 385

**Everybody Has a Story** Turning a Spark into an Inferno 386

What Are the Health Benefits of Physical Activity? 387

Physical Activity Improves Health and Physical Fitness 387 • Five Components of Physical Fitness 389 • Getting “FITT” Involves Frequency, Intensity, Type, and Time 391

How Does Physical Activity Impact Energy Metabolism? 394

ATP Can Be Generated by Aerobic and Anaerobic Pathways 395

**Focus on Sports Nutrition** Do Creatine Supplements Enhance Athletic Performance? 398

What Physiologic Adaptations Occur in Response to Athletic Training? 401

Both Strength and Endurance Training Improve Athletic Performance 401 • Some Athletes Use “Performance-Enhancing” Aids 402

How Does Physical Activity Influence Dietary Requirements? 405

Energy Requirements to Support Physical Activity 405 • Recommendations for Macronutrient Intake Are Similar for Physically Active and Sedentary Individuals 406

**Focus on Sports Nutrition** Carbohydrate Loading and Athletic Performance 407  
An Adequate Diet Is Likely to Satisfy Micronutrient Requirements 408 • Exercise Increases the Need for Fluid

and Electrolytes 409 • Nutrition Plays an Important Role in Post-Exercise Recovery 411

## CHAPTER 10 Water-Soluble Vitamins 417

**Everybody Has a Story** “I’m Sorry, But Your Baby Has a Neural Tube Defect” 418

The Water-Soluble Vitamins: A Primer 419  
Water-Soluble Vitamins Tend to Have Similar Properties 419 • Water-Soluble Vitamins Function in Diverse Ways 419 • Some Vitamins Have Several Names 419 • Some Foods Are “Enriched” or “Fortified” with Micronutrients 422 • Water-Soluble Vitamins Can Be Destroyed by Cooking and Improper Storage 422

Thiamin (Vitamin B<sub>1</sub>)—Needed for Production of Acetyl Coenzyme A 424  
Whole Grains, Pork, and Fish Are Rich in Thiamin 424  
**Food Matters** Working Toward the Goal: Consuming Whole-Grain Foods to Optimize Your Intake of Water-Soluble Vitamins 425  
“Antithiamin Factors” Decrease Thiamin Bioavailability 426 • Thiamin Is Critical for ATP Production 426 • Thiamin Deficiency Results in Beriberi 427 • Recommended Intakes of Thiamin 427

Riboflavin (Vitamin B<sub>2</sub>)—Coenzyme Required for Reduction–Oxidation Reactions 428  
Meats and Dairy Products Are Rich Sources of Riboflavin 428 • Riboflavin Assists in Reduction–Oxidation (Redox) Reactions 429 • Riboflavin Deficiency Causes Ariboflavinosis 429 • Recommended Intakes of Riboflavin 429

Niacin (Vitamin B<sub>3</sub>)—Required for Energy Metabolism 430  
Meat and Mushrooms Are Good Sources of Niacin 430 • Niacin Is Involved in Reduction–Oxidation (Redox) Reactions 432 • Niacin Deficiency Results in Pellagra 432 • Recommended Intakes of Niacin 432

Pantothenic Acid (Vitamin B<sub>5</sub>)—A Component of Coenzyme A 433  
Pantothenic Acid Is Found in Most Plant and Animal Foods 433 • Pantothenic Acid Is Needed for Glycolysis and the Citric Acid Cycle 434 • Recommended Intakes for Pantothenic Acid 434

Vitamin B<sub>6</sub>—Critical for Metabolism of Amino Acids 434  
Chickpeas, Tuna, and Liver Are Rich in Vitamin B<sub>6</sub> 434 • Vitamin B<sub>6</sub> Is Needed for Making Nonessential Amino Acids 434 • Vitamin B<sub>6</sub> Deficiency Causes Microcytic Hypochromic Anemia 435 • Too Much Vitamin B<sub>6</sub> Can Be Toxic 436 • Recommended Intakes of Vitamin B<sub>6</sub> 436

Biotin (Vitamin B<sub>7</sub>)—Coenzyme for Carboxylation Reactions 436  
Nuts, Mushrooms, and Eggs Are Rich in Biotin 437 • Biotin Adds Bicarbonate (HCO<sub>3</sub><sup>-</sup>) Subunits in Carboxylation Reactions 438 • Recommended Intakes for Biotin 438

Folate—Required for Methylation Reactions 438  
Green Leafy Vegetables Are Rich Sources of Folate 438 • Folate Facilitates Single-Carbon Transfers 439 • Folate Deficiency Causes Megaloblastic Macrocytic Anemia 442 • Recommended Intakes of Folate 442

Vitamin B<sub>12</sub> (Cobalamin)—Vitamin Made Only by Microorganisms 442  
Microorganisms Produce Vitamin B<sub>12</sub> 443 • Vitamin B<sub>12</sub> Is Involved in ATP and Methionine Production 444 • Vitamin B<sub>12</sub> Deficiency Causes Pernicious Anemia 444 • Recommended Intakes for Vitamin B<sub>12</sub> 445

Vitamin C (Ascorbic Acid)—Critical Antioxidant 445  
Many Fruits and Vegetables Are Rich Sources of Vitamin C 445 • Vitamin C Is a Potent Antioxidant 445 • Vitamin C Is Important for Immune Function 448 • Vitamin C Deficiency Causes Scurvy 448 • Recommended Intakes for Vitamin C 449

Is Choline a “New” Conditionally Essential Nutrient? 449  
Eggs Are Rich Sources of Dietary Choline 449 • Choline Deficiency Is Rare 450

Carnitine—Needed for Fatty Acid Transport 450  
Carnitine Carries Fatty Acids across Membranes 450

Summary of the Water-Soluble Vitamins and Use of Supplements 451  
Dietary Supplements Can Contain Many Substances 452

## CHAPTER 11 Fat-Soluble Vitamins 459

**Everybody Has a Story** Living Successfully with Factor V Leiden Thrombophilia 460

What Makes the Fat-Soluble Vitamins Unique? 461  
Each Fat-Soluble Vitamin Has Several Names 461

Vitamin A and the Carotenoids—Needed for Eyesight and Much More 462  
Vitamin A and Provitamin A Carotenoids Are Found in Diverse Plant and Animal Foods 463 • Absorption of Vitamin A and the Carotenoids Requires Adequate

Lipids 464 • Vitamin A Is Critical for Vision, Growth, and Reproduction 465 • Nonprovitamin A Carotenoids Are Potent Antioxidants 467 • Vitamin A Deficiency Causes Vitamin A Deficiency Disorder (VADD) 468 • Vitamin A Toxicity Causes Hypervitaminosis A 469 • Recommended Intakes for Vitamin A and the Carotenoids 469

**Focus on Diet and Health** Vitamin A and International Child Health 470

### Vitamin D—The “Sunshine Vitamin” 471

Vitamin D Is Found Naturally in Only a Few Foods 471 • Vitamin D Is Also Made in the Skin 472 • Dietary Vitamin D Absorption and Vitamin D Activation 473 • Vitamin D Regulates Calcium Homeostasis, Gene Expression, and Cell Differentiation 473 • Vitamin D Deficiency May Be Relatively Common 475

**Focus on Diet and Health** Vitamin D—Needed for More Than Just Healthy Bones 476

Recommended Intakes and Vitamin D Toxicity 477

### Vitamin E—Antioxidant That Protects Biological Membranes 477

Vitamin E Is Abundant in Oils, Nuts, and Seeds 477 • Vitamin E Is a Potent Antioxidant 478 • Vitamin E Deficiency Causes Hemolytic Anemia 480 • Recommended Intakes for Vitamin E 480

### Vitamin K—Critical for Coagulation 480

Vitamin K Is Found Naturally in Dark Greens, Fish, and Legumes 481 • Vitamin K Involved in Blood Clotting Cascade 481 • Vitamin K Deficiency Can Cause Severe Bleeding 482

**Focus on Clinical Applications** Nutrient–Drug Interactions and Vitamin K 483

### Fat-Soluble Vitamins: Summary and Overall Recommendations 483

**Food Matters** Working Toward the Goal: Increasing Fat-Soluble Vitamin Intake via Fruits and Vegetables 484

### Nutrition Matters Nutrition and Cancer 489

#### How Does Cancer Develop? 489

Cancer Develops in a Multistep Manner 490

#### How Is Cancer Detected and Treated? 491

Routine Cancer Screening Is Recommended 491 • There Are Many Treatment Options for Cancer 492 • Cancer and Its Treatments Can Influence Nutritional Status 492

#### What Other Factors Are Related to Risk of Cancer? 492

Biological Factors Are Related to Cancer Risk 493 • Lifestyle and Environmental Factors Impact Cancer Risk 494

#### Can Optimal Nutrition Help Prevent Cancer? 495

Recommendation #1: Maintain a Healthy Body Weight 496 • Recommendation #2: Be Physically Active 497 • Recommendation #3: Limit Consumption of Energy-Dense Foods and Sweetened Beverages 497 • Recommendation #4: Eat Mostly Foods of Plant Origin 497 • Recommendation #5: Limit Intake of Red Meat and Processed Meat 499 • Recommendation #6: Limit Alcohol 499 • Recommendation #7: Limit Salt and Avoid Moldy Grains and Legumes 499 • Recommendation #8: Choose Foods Over Supplements 500 • Special Recommendation #1: Women Should Breastfeed Their Infants 500 • Special Recommendation #2: Cancer Survivors Should Follow the Same Recommendations 500

#### Diet and Cancer: What Is in the Future? 500

## CHAPTER 12 The Major Minerals and Water 505

**Everybody Has a Story** JoAnn’s Challenge with Bone Health 506

### What Are Minerals? 507

Common Characteristics of Major Minerals 507

### Calcium—The Body’s Most Abundant Mineral 509

Dietary and Supplemental Sources of Calcium 509

**Food Matters** Working Toward the Goal: Increasing Calcium and Potassium Intakes by Consuming Low-Fat Dairy Foods 510

Calcium Homeostasis Is Complex 510 • Calcium Is Needed for More than Bones and Teeth 512

**Focus on Food** Milk Consumption and Chronic Disease Prevention 513

Calcium and Bone Health 513 • Calcium Deficiency Also Affects Nerve and Muscle Function 514 • Calcium Toxicity Can Cause Kidney Stones and Calcification of Soft Tissues 514 • Recommended Intakes for Calcium 514

### Phosphorus—A Component of Biological Membranes 515

Phosphorus Is Abundant in Protein-Rich Foods 515 • Regulation of Blood Phosphorus Levels Is Similar to That of Calcium 516 • Additional Roles for Phosphorus 516 • Phosphorus Deficiency Is Rare; Toxicity Causes Mineralization of Soft Tissues 516

### Magnesium—Needed for Building Bones and Stabilizing Enzymes 517

Beans, Nuts, and Seeds Are Excellent Sources of Magnesium 517 • Blood Levels of Magnesium Are Regulated by the Small Intestine and Kidneys 517 • Magnesium Is Important for Bones and to Stabilize Anions 518 • Magnesium Deficiency and Toxicity Are Rare 518 • Recommended Intakes for Magnesium 518

### Sodium and Chloride—Regulators of Fluid Balance 518

Sodium and Chloride Contents of Foods Are Readily Available 519 • Sodium Absorption Requires Glucose 520 • Blood Sodium Levels Are Carefully Regulated 520 • Sodium and Chloride Are Electrolytes 520 • Sodium and Chloride Deficiencies Can Occur during Illness and Physical Exertion 521 •

Overconsumption of Sodium Chloride Increases Blood Pressure in Some People 522 • Recommended Intakes for Sodium and Chloride 522

### Potassium—An Important Intracellular Cation 523

Potassium Is Found in a Variety of Fruits, Vegetables, Dairy Products, and Meat 523 • Potassium Is the Body's Major Intracellular Cation 524 • Potassium Deficiency and Toxicity 524

### Water—The Essence of Life 525

Distribution of Water in the Body 525 • Fluid (Water) Balance Is Shifted by Movement of Electrolytes 526 • Water Is Essential for Life 527 • Water Insufficiency Causes Dehydration 528

**Focus on Clinical Applications** Electrolytes, Fluid Balance, and Cystic Fibrosis 529

Recommendations for Water Intake 531

### How Are the Functions and Food Sources of the Major Minerals Related? 532

**Focus on Diet and Health** Coffee, Caffeine, and Health 533

### Nutrition Matters Nutrition and Bone Health 540

#### Do Bones Continue to Develop and Grow Throughout Life? 540

Bone Tissue Is Complex and Living 540 • Bones Are Made of Osteoblasts and Osteoclasts 541

#### What Causes Osteoporosis? 542

There Are Two Types of Osteoporosis 543 • Osteoporosis Can Seriously Affect Health and Well-Being 544 • Biological and Lifestyle Factors Increase Risk for Osteoporosis 544

#### Are You at Risk? 546

For Most People, Screening Should Begin at Age 65–70 Years 546 • Osteoporosis Can Be Treated with Medications 546 • Optimal Nutrition Is Critical for Bone Health 547

## CHAPTER 13 The Trace Minerals 553

**Everybody Has a Story** Living Life As an “Iron Man” 554

### What Do the Trace Minerals Have in Common? 555

Regulation of Trace Minerals in the Body 555 • Trace Minerals Act as Cofactors and Prosthetic Groups and Provide Structure 555

### Iron—Transporter of Oxygen 556

Iron Is in Both Plant- and Animal-Derived Foods 556 • Many Factors Influence Iron Bioavailability 557 • Iron Absorption Is Tightly Regulated 558 • Iron Is a Component of Heme and Nonheme Proteins 560 • Iron Deficiency Causes Anemia and Much More 562 • Iron Toxicity Can Be Fatal 564 • Recommended Intakes for Iron 564

### Copper—Cofactor in Redox Reactions 565

Organ Meats Are Excellent Sources of Copper 565 • Excess Copper Is Eliminated in Bile 565

**Food Matters** Working Toward the Goal: Increasing Trace Mineral Intake via Nuts and Seeds 566

Copper Is Involved in Reduction–Oxidation (Redox) Reactions 566 • Copper Deficiency and Toxicity Are Rare 566

### Iodine (Iodide)—An Essential Component of the Thyroid Hormones 567

Marine Foods Supply Iodine Naturally 567

**Focus on the Process of Science** Iodine Deficiency and Iodination of Salt 568

Goitrogens Inhibit Iodine Utilization 568 • Iodine Is a Component of Thyroid Hormones 569 • Iodine Deficiency Causes Cretinism and Goiter 569 • Recommended Intakes for Iodine 570

### Selenium—A Mineral with Antioxidant Functions 570

Nuts, Seafood, and Meats Are Rich in Selenium 570 • Selenium Is Incorporated into Selenoproteins 571 •

Selenium Is an Important Antioxidant 571 • Selenium Deficiency and Toxicity: Keshan Disease and Selenosis 572

### Chromium—Implicated in Glucose Homeostasis 572

Chromium Content of Foods Depends on Chromium Content of Soil 572 • Chromium May Be Involved in Glucose Homeostasis 572 • Chromium Deficiency and Toxicity Are Rare 573 • Recommended Intakes for Chromium 573

### Manganese—Important for Gluconeogenesis and Bone Formation 573

Plant Foods Are the Best Sources of Manganese 573 • Severe Manganese Deficiency Causes Weak Bones and Slow Growth 574

### Molybdenum—Required in Very Small Quantities 574

Legumes, Nuts, and Grains Provide Molybdenum 574 • Molybdenum Deficiency Is Exceedingly Rare 574

### Zinc—Involved in RNA Synthesis and Gene Expression 574

Zinc Is Found in Shellfish, Organ Meats, and Dairy Foods 575 • Zinc Absorption Is Regulated Similarly to Iron 575 • Zinc Is Involved in RNA Synthesis and Gene Expression 576 • Vegetarians May Need Additional Zinc 576

### Fluoride—Nonessential Mineral That Strengthens Bones and Teeth 576

Many Communities Fluoridate Their Water 577 • Fluoride Strengthens Bones and Teeth 577 • Fluoride Toxicity Results in Fluorosis 577

### Are There Other Important Trace Minerals? 577

### Integration of Functions and Food Sources 578

**Everybody Has a Story** Backyard Harvest 584

What Physiological Changes Take Place during the Human Life Cycle? 585

Growth and Development Take Place at Various Times during the Life Cycle 585 • Nutrient Requirements Can Change for Each Stage of the Life Cycle 586

What Are the Major Stages of Prenatal Development? 587

Prenatal Development Is Divided into Embryonic and Fetal Periods 587 • Gestational Age Is Important to Assess 590

What Are the Recommendations for a Healthy Pregnancy? 592

**Focus on the Process of Science** Developmental Origins of Health and Disease 593

Recommended Weight Gain Depends on BMI 594 • Maternal Nutrient and Energy Requirements Change during Pregnancy 594 • Maternal Smoking Is Harmful to the Fetus 598 • Staying Healthy during Pregnancy 598 • Pregnancy-Related Health Concerns 599

**Food Matters** Working Toward the Goal: Selecting Foods during Pregnancy 601

Why Is Breastfeeding Recommended during Infancy? 601

Lactation Is the Process of Milk Production 601 • Milk Production Is a Matter of Supply and Demand 602 • Human Milk Is Beneficial for Babies 603 • Lactation Influences Maternal Energy and Nutrient Requirements 604 • Breastfeeding Is Beneficial for Mothers 605

What Are the Nutritional Needs of Infants? 606

Infant Growth Is Assessed Using Growth Charts 606 • Developmental Stages Provide the Basis for Recommended Infant Feeding Practices 608 • Nutrient Supplementation Recommendations Are Based on Whether the Infant Is Breastfed or Formula Fed 609 • Complementary Foods Can Be Introduced between 4 and 6 Months of Age 611

What Are the Nutritional Needs of Toddlers and Young Children? 612

Growth and Development Influence Nutritional Needs of Toddlers and Young Children 613 • Feeding Behaviors in Children 613

**Focus on Diet and Health** Overweight Children: A Growing Concern 615

Recommended Energy and Nutrient Intakes for Toddlers and Young Children 617 • Dietary Guidelines for Toddlers and Young Children 618

How Do Nutritional Requirements Change during Adolescence? 618

Growth and Development during Adolescence 619 • Nutritional Concerns and Recommendations during Adolescence 620

How Do Age-Related Changes in Adults Influence Nutrient and Energy Requirements? 621

Adulthood Is Characterized by Physical Maturity 621 • There Are Many Theories as to Why We Age 622 • Nutritional Issues of Adults 623

**Focus on Clinical Applications** Dietary Options for Perimenopausal and Menopausal Women 626  
Assessing Nutritional Risk in Older Adults 628

**Nutrition Matters** Food Security, Hunger, and Malnutrition 634

What Is Food Security? 634

People Respond to Food Insecurity in Different Ways 635 • Poverty Is the Underlying Factor Associated with Food Insecurity 635

What Are the Consequences of Food Insecurity? 636

Many Organizations Provide Food-Based Assistance in the United States 637

What Causes Worldwide Hunger and Malnutrition? 639

Many Factors Contribute to Global Food Insecurity 639 • Global Food Insecurity Results in Malnutrition 640 • International Organizations Provide Food-Based Assistance to the Global Community 642

What Are Potential Solutions for Global Food Insecurity and Malnutrition? 643

Alleviating Food Insecurity and Malnutrition 643 • Taking Action Against Hunger Can Make a Difference 644

# LIST OF FOCUS ON BOXES

## CHAPTER 1

**Focus on Food** Understanding What Is Meant by “Organic Foods” 7

**Focus on Diet and Health** Industrialization, Population Growth, and the Nutrition Transition 27

## CHAPTER 2

**Focus on Food** What Makes a Food Kosher? 60

**Focus on Food** The *Buy Fresh Buy Local* Campaign 62

## CHAPTER 3

**Focus on Clinical Applications** Peptic Ulcers and Gastroesophageal Reflux Disease 95

**Focus on Clinical Applications** Celiac Disease 102

**Focus on Clinical Applications** Cranberry Juice and Urinary Tract Infections 107

**Focus on Clinical Applications** Irritable Bowel Syndrome and Inflammatory Bowel Disease 109

**Focus on Clinical Applications** Probiotic and Prebiotic Foods 110

## CHAPTER 4

**Focus on Diet and Health** Is High-Fructose Corn Syrup Contributing to the Obesity Epidemic? 118

**Focus on Food** Are Nonsugar Sweeteners Beneficial to Health? 122

**Focus on the Process of Science** The Story of the Pima Indians 156

## CHAPTER 5

**Focus on Food** Genetically Modified Organisms (GMOs) and Protein Quality 167

**Focus on Clinical Applications** Sickle Cell Anemia 171

**Focus on the Process of Science** Personalized Nutrition Based on Genetic Makeup 176

**Focus on Sports Nutrition** Do Protein and Amino Acid Supplements Enhance Athletic Performance? 190

## CHAPTER 6

**Focus on Diet and Health** *Trans* Fat–Free Zones 224

**Focus on Life Cycle Nutrition** Optimal Lipid Nutrition during Infancy 228

**Focus on Clinical Applications** Gallbladder Disease and Gallstones 239

**Focus on Food** The Skinny on Fat Substitutes 247

## CHAPTER 7

**Focus on Diet and Health** Can Ketogenic Diets Help Control Epilepsy? 293

**Focus on Diet and Health** Chronic Caloric Restriction and Longevity 297

**Focus on the Process of Science** Keys Starvation Experiment 299

## CHAPTER 8

**Focus on Clinical Applications** Bariatric Surgery 327

**Focus on Food** Food Cravings and Food Aversions 330

**Focus on Food** Eating More and Weighing Less 354

## CHAPTER 9

**Focus on Sports Nutrition** Do Creatine Supplements Enhance Athletic Performance? 398

**Focus on Sports Nutrition** Carbohydrate Loading and Athletic Performance 407

## CHAPTER 11

**Focus on Diet and Health** Vitamin A and International Child Health 470

**Focus on Diet and Health** Vitamin D—Needed for More Than Just Healthy Bones 476

**Focus on Clinical Applications** Nutrient–Drug Interactions and Vitamin K 483

## CHAPTER 12

**Focus on Food** Milk Consumption and Chronic Disease Prevention 513

**Focus on Clinical Applications** Electrolytes, Fluid Balance, and Cystic Fibrosis 529

**Focus on Diet and Health** Coffee, Caffeine, and Health 533

## CHAPTER 13

**Focus on the Process of Science** Iodine Deficiency and Iodination of Salt 568

## CHAPTER 14

**Focus on the Process of Science** Developmental Origins of Health and Disease 593

**Focus on Diet and Health** Overweight Children: A Growing Concern 615

**Focus on Clinical Applications** Dietary Options for Perimenopausal and Menopausal Women 626

# EVERYBODY HAS A STORY: Michelle “Shelley” McGuire

Courtesy of The Dannon Institute

**Dr. Michelle “Shelley” McGuire** got her academic start in the small town of Polo, Illinois, where her mother-in-law-to-be (a high school English teacher) taught her how to write, and her family and community instilled within her a strong Midwestern work ethic and love of learning. Shelley earned a bachelor’s degree in biology from the University of Illinois, a master’s degree in nutritional sciences from the University of Illinois, and a doctorate in human nutrition (with minors in physiology and international nutrition) from Cornell University. She is now a faculty member at Washington

State University, where she conducts research related to nutrition and lactation. Recent research, conducted in collaboration with her husband Dr. Mark McGuire (University of Idaho) and funded primarily by the National Institutes of Health and the Bill and Melinda Gates Foundation, has focused on the discovery that human milk naturally contains “healthy” bacteria that likely benefit both mothers and infants. Shelley is an active member of the American Society for Nutrition, for which she is a National Spokesperson and a member of various committees. She is also a member of the International Society for Research in Human Milk and Lactation, for which she is secretary/treasurer. Dr. McGuire has been enthusiastically teaching Washington State University’s basic nutrition course for mixed majors for over 15 years and has a strong appreciation for its goals and objectives, as well as the wide variety of student needs associated with the course. She also teaches an upper-level science communications course for biology majors. These experiences, coupled with her strong writing skills, research background, and personal connections within the international nutrition research community, have helped her create an exciting and refreshing text for the introductory nutrition course. When Shelley is not writing, teaching, or overseeing research, she enjoys being with family and friends, traveling, running, practicing yoga, cooking, gardening, and performing classical music.

*With continued gratitude to Mark, Emily, Grace, and Keith for providing my “equilibrium” each and every day.*

*This book is dedicated to my dear “academic mothers” and mentors— Drs. Mary Frances Picciano and Kathleen Rasmussen. Mary Frances, thank you for gently yet securely diverting me from a path leading straight to medical school to one paving the way to academia. You taught me that a woman can be both a serious scientist and a devoted mother/wife. You also taught me that husband/wife academic teams can be incredibly productive, loving, and long-lasting. I miss your advice and wit on a daily basis. Kathy, your guidance and continued support have been invaluable. From experimental design to statistical analysis; from critical evaluation of the literature to application of current science to public health recommendations; from listening to me to providing leadership opportunities. I cannot adequately express my appreciation for all you have done and continue to do for me. You both believed in and encouraged me when I was weary and unsure of how a sensitive female could possibly cope in the sometimes brutal world of rigorous science. Thank you for teaching me that critical evaluation and continued questioning of dogma require humility, humor, courage, persistence, and (especially) a sturdy backbone.*

*Shelley*

# EVERYBODY HAS A STORY: Kathy Beerman

*I express my deepest gratitude to those who supported me through the many twists and turns of this endeavor. I am very fortunate to have such wonderful friends, and you have each contributed to this book in many ways. I am especially grateful to my husband, children, brother, and sister-in-law who provided endless and unwavering love each step of the way. My greatest inspiration comes from my father, Morris Beerman, whose profound wisdom has guided me throughout life. It is to him that I dedicate this book.*

Kathy

Courtesy of Washington State University

**Dr. Kathy Beerman** was born and raised in Buffalo, New York. She earned her bachelor's and master's degrees from the State University of New York at Brockport, Department of Health Sciences. Although her urban, East Coast roots run deep, she relocated to Corvallis, Oregon, to attend graduate school at Oregon State University, where she earned her PhD. After finishing her doctorate, Kathy and her husband (Steven) moved to Moscow, Idaho. Now a professor of nutrition, Kathy teaches in the School of Biological Sciences at Washington State University. The author of several published articles, she

specializes in research focusing on dietary practices of college students and the effects of isoflavones on health parameters (immune response, thyroid function, and memory) in postmenopausal women. A collaborative clinical intervention study currently underway involves the assessment of L-arginine and L-citrulline oral supplementation on blood pressure in hypertensive men. She is a member of the American Society for Nutrition. Dr. Beerman teaches the introductory nutrition course for health-related majors, as well as courses in nutrition education, biology of women, and life cycle nutrition. She also provides educational training to graduate students in preparation for instructional roles as teaching assistants. Dr. Beerman will also be co-teaching a course with her husband in Puntarenas, Costa Rica, that explores the connectivity between agriculture, environmental quality, human nutrition, and health. Since joining the faculty at Washington State University in 1989, she has taught more than 15,000 students, and has been the recipient of several college and university teaching awards including the Burlington Northern Faculty Meritorious Achievement in Teaching Award, the R. M. Wade Foundation Award for Excellence in Teaching, and the WSU Mortar Board (honor society of college seniors) Distinguished Professor Award. In 2008, Dr. Beerman was awarded the highest teaching honor offered at Washington State University—the Sahlin Faculty Excellence Award for Instruction. In addition, Dr. Beerman was inducted into the President's Teaching Academy at Washington State University, which is composed of faculty members who provide leadership to strengthen undergraduate and graduate teaching and learning. Dr. Beerman's years of teaching experience combined with her wide knowledge base in nutrition and health sciences have helped her create this innovative introductory nutrition textbook. At home, Kathy enjoys spending time with her husband, Steven, and children, Anna and Michael. She also enjoys traveling, gardening, running, and being a part of the Moscow community.

# PREFACE

Like you, we teach introductory nutrition at the college level, and our experiences in the classroom have taught us many things. We would like to share two primary insights that shaped the inception of this textbook and have guided us throughout the writing of each edition.

- First and foremost, an introductory nutrition textbook must explain nutrition concepts accurately, clearly, and completely in a way that all students, regardless of level or background, can understand. To do this most effectively, it is essential to provide students with fundamental scientific concepts. Only then can these concepts be applied to the science of nutrition in a meaningful way.
- For some students, scientific concepts are abstract and difficult to grasp. For this reason, the use of well-designed figures greatly enhances learning by providing integrated, contextually-based illustrative examples.

These two straightforward observations formed the genesis of this textbook. It is our hope that this book will allow all students, *even those with little or no science background*, to find the science of nutrition approachable, understandable, and—perhaps most imperative—useful in their lives.

Critically important to the evolution of this textbook is our commitment to getting the facts straight, updating the text as new knowledge unfolds, and presenting information in an objective, unbiased manner. As such, the revision process is an integral part of all stages of textbook development, writing, and implementation. When necessary, subject matter experts are consulted to clarify concepts, discuss implications of a new study, provide commentary on new scientific discoveries, or even help us define terms. If you are one of these people we have reached out to, thank you! We also attend national meetings, participate in conferences, and seek out nutrition-related events to ensure that we are on the cutting edge of the science. In addition, and perhaps most importantly, we use this textbook in our classrooms and solicit feedback from our students. Sometimes we learn as much from them as they learn from us.

All of these approaches made us even more eager to roll up our sleeves and dive into this new edition. If you used previous editions of this book, you will immediately notice that many changes have been made to every chapter. These changes are described in more detail later in this preface. Although we are confident that this book is one of the most accurate, clearly written, current, beautiful, and student-friendly nutrition books available, we will have already started working on the next edition by the time you are reading this page. Please do not hesitate to let us know whether these changes address your needs and those of your students, as well as what you would like us to address in subsequent editions.

## The Fundamentals Are Important

We think you will agree that students need a strong knowledge base to master nutrition concepts. Without knowledge of fundamental scientific principles and associated vocabulary, many capable students in introductory nutrition courses are lost from the start. For example, when teaching nutrition we often

refer to chemical bonds—how else do we distinguish between saturated and unsaturated fatty acids? Similarly, when teaching the importance of ATP, we discuss the breaking of phosphate bonds. But how can a student grasp these concepts without understanding what a chemical bond is? The solid scientific foundation provided by this book will enable students to navigate through the most difficult of concepts, regardless of their background. For example, Chapter 3 not only introduces the basic principles of chemistry, biology, and physiology, but also applies these concepts to the study of nutrition. To our knowledge, this is the first introductory nutrition textbook to present such a “primer” on nutritional biochemistry and physiology at the level appropriate for both science and nonscience students. In fact, because we believe that the fundamentals are so crucially important, we worked hard to define and describe each new science-based term and concept when it is introduced. You will see evidence of this in every chapter.

## An Integrated, Yet Systematic, Approach

As the field of nutrition grows, so does the amount of information we must teach. Consequently, it can be difficult to cover the necessary basic science and applied aspects of nutrition in a single semester. For instance, it is important to first learn about *all* the related micronutrients and macronutrients before launching into a full discussion of nutrition and bone health. Therefore, our approach has been to “lead” with the basics, followed by application whenever possible. To accomplish this, we have organized the text in a methodical, integrated manner. First, the main chapters of the book are organized in the traditional way—starting with the macronutrients and then discussing the micronutrients. However, applied concepts are integrated throughout the book. For example, active and passive transport mechanisms are carefully described in Chapter 3, but then referred to in subsequent chapters throughout the book. Another pedagogical tool, called **Connections**, is conveniently placed on pages to provide students with a quick reminder of important terms and concepts. Similarly, a structural organization of headings and subheadings provides students with a framework that presents a broad view, which then progresses to a more detailed examination of information. By posing first-level headings as questions, students are able to self-check to ensure they are extracting critical information.

Second, we have continued to use a feature entitled **Focus on...**, which highlights issues related to scientific innovation, diet and health, food, clinical applications, life cycle nutrition, and sports nutrition. These features assimilate topics that are of great interest to students within appropriate chapters, and are especially useful to instructors who do not have time to more extensively cover them during the semester. For example, a Focus on... discussion of high-fructose corn syrup accompanies the section on simple sugars, and a Focus on... discussion of nutrient–drug interactions accompanies the section on vitamin K. Most chapters have several Focus on... features, which students will enjoy reading and from which they will learn a great deal. In fact, these features received high praise from our students, who found the topics interesting and provocative.

Third, to improve the integration of important nutrients related to the maintenance of health or the risk for chronic disease, we include segments called **Nutrition Matters**, which conclude most of the chapters. These “minichapters” deal with important nutrition-related issues—such as food safety, nutrition and cancer, and dysfunctional eating. They are up-to-date and comprehensive, yet clear and student-friendly. Because these pieces conclude most chapters, instructors can easily choose to assign them in

any order that works for their class, or not assign them at all if time does not allow.

## Putting a *Personal Face* on Nutritional Science

We all know that stories can greatly enhance learning. Without a doubt, teachers double as storytellers. If you are like us, your “stories” are often about people with nutrition-related challenges in their lives. And you would probably agree that everybody has such a story to tell. A special feature called **Everybody Has a Story** made its first debut in the second edition of the textbook. As in the second edition, each chapter opens with a story about a person with a real nutrition-related challenge. In this new edition, we are pleased to introduce several new people, all of whom generously shared their captivating stories. It is our hope that students can relate to these stories and refer back to them as they read the chapter. For example, Chapter 2 (Nutritional Assessment and Dietary Planning) features Emily, a student studying at the University of Cincinnati. This story was selected to get students to think about how easily overlooked medical conditions—such as celiac disease—can cascade into a host of nutrient-related concerns, especially in college students facing a multitude of changes and stresses in their lives. Chapter 8 (Energy Balance and Body Weight Regulation) features August, who describes her lifelong struggle with obesity and her decision to have gastric bypass surgery after repeated failed weight-loss attempts. This story presents a thought-provoking perspective to students about the physical, psychological, and sociocultural aspects of obesity. Most importantly, it challenges students to examine their beliefs about this sensitive topic. We are hopeful that these personal stories will help students connect the fundamentals of nutritional science to everyday living and health.

This book also provides numerous opportunities for students to apply their knowledge to the art and science of making their own good food choices on a daily basis. The **Food Matters** sections, for example, help transform the 2010 Dietary Guidelines for Americans (which are described in detail in Chapter 2) into practical ideas for choosing and preparing foods in the most health-conscious manner. These pieces can be found in most chapters, helping integrate the fundamental concepts into personal food-related decisions.

## Book Length

Most introductory nutrition courses are taught over one quarter or semester. Yet textbooks written for these courses typically contain substantially more information than can be covered within a 10- to 15-week period. Addressing concepts in a concise manner has enabled us to create a slimmer, trimmer textbook that can be more easily covered in a single semester. Additional resources that might otherwise be found in an appendix are conveniently provided to students via the book’s website or can be bundled as supplements to the textbook. An example is the food composition table, which can be provided free as a separate booklet with every new text.

## Pedagogical Tools

As previously described, we are convinced that outstanding illustrations enhance learning. All students benefit from seeing scientific concepts articulated in clear, well-organized illustrations. The figures, tables, and graphs in

this book were designed using a unique captioning system, and the consistent use of blue text boxes and lines quickly identifies the key points of each figure. Many of our visual summaries take students step by step through complex processes, from the whole-body “big picture” to the details. We affectionately refer to these as “you are here” illustrations and have noticed other textbook writers adopting this idea and using it in their books as well.

Additionally, and to help with recognition, extra effort has been made to ensure that components found in many figures are displayed consistently throughout the book. For example, the anatomical drawings are rendered in the same way so that various organs such as the liver, pancreas, and stomach have a consistent appearance; glucose is always colored blue; and phospholipids are always drawn and colored the same way.

In addition to beautiful illustrations, each chapter contains a number of helpful tools that assist students in learning the material. New to this edition, tear-out **Study Cards** are gathered on perforated card stock at the back of the book. These cards include not only chapter summaries that identify key concepts, arranged by major subject headings, but also review questions that enable students to test their knowledge. Question types include multiple choice, essay, and practice calculations (specific mathematics-related problems encountered in nutrition). Using these cards, students can easily identify content that requires further review and locate where the information is presented in the chapter. Students can also carry these handy summaries and questions instead of the book to conveniently review key concepts and definitions for exams. In addition, **Diet Analysis PLUS Activities** are included at the end of most chapters. These activities are designed to relate the chapter concepts to the dietary analysis software that can accompany this text.

## New to the Third Edition

Perhaps most exciting to us are the many subtle and not-so-subtle changes we have made to transform this book into its third edition. Many of these changes were made in response to excellent feedback that we received from both colleagues and students, and we thank you all for helping us make this edition even better. First, you can look forward to reading new challenges in the **Everybody Has a Story** features, and we welcome your feedback on how these helped in the classroom. In this edition, we also worked to strengthen the writing by using a more direct, inclusive voice. We hope that this style will resonate with students, and help them grasp important concepts more readily.

And, of course, throughout the book we have updated all of the nutrition-related guidelines (such as the 2010 Dietary Guidelines for Americans and MyPlate food guidance system) and programs (such as the National School Breakfast and Lunch Programs) discussed, as well as health statistics. Importantly, the timing of this edition nicely coincided with the releases of the 2010 Dietary Guidelines for Americans and the MyPlate food guidance system—cogent events that serve as the cornerstones of nutritional guidance. We are indeed fortunate, therefore, that they are aptly described and incorporated into this newly released book. Another of the most important considerations during the revision process was to avoid layering new material on top of old. Therefore, sections that no longer seemed relevant or supported by the literature were removed.

Perhaps most important to any rigorous college-level textbook, each chapter now includes new information that reflects changes to our knowledge that have surfaced since the last edition was released. Some of these are highlighted here.

## **Chapter 1 (The Science of Nutrition)**

- Added new Focus on... concerning “Industrialization, Population Growth, and the Nutrition Transition.”

## **Chapter 2 (Nutritional Assessment and Dietary Planning)**

- Replaced previous Everybody Has a Story piece with one describing Emily, a college student who learns she has secondary iron deficiency caused by celiac disease.
- Updated discussion of DRIs to include new values for calcium and vitamin D released in 2011.
- Replaced information related to the 2005 Dietary Guidelines for Americans and MyPyramid food guidance system with that reflecting the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.
- Updated descriptions of Healthy People to reflect newest edition (2010), and introduced the relevance of the Healthy, Hunger-Free Kids Act of 2010 to our nation’s youth.

## **Chapter 3 (Chemical, Biological, and Physiological Aspects of Nutrition)**

- While this chapter continues to provide a strong foundation in physiological functions, we have provided more examples that demonstrate their applicability to the study of nutrition.
- Added a new Everybody Has a Story chapter opener featuring a high school student who was experiencing an unspecified illness that was eventually diagnosed as Crohn’s disease.

## **Chapter 4 (Carbohydrates; Nutrition and Diabetes)**

- Added a new Everybody Has a Story chapter opener featuring an Ironman® competitor who faces the challenges of training while also dealing with the complications of having type 1 diabetes.
- Updated information regarding the controversy on high-fructose corn syrup and obesity.
- Updated information based on the 2010 Dietary Guidelines for Americans regarding added sugar consumption in the United States.
- Updated information based on the 2010 Dietary Guidelines for Americans regarding emphasis on fiber, fruit, and vegetable intake.
- Relocated information on metabolic syndrome from Chapter 4 to Chapter 8 in order to broaden the discussion of its relevance to obesity.
- Updated CDC trend maps showing recent regional estimates of adults with diagnosed diabetes.
- Incorporated 2010 Dietary Guidelines for Americans and MyPlate food guidance system where appropriate.
- Included American Diabetes Association’s 2011 guidelines for carbohydrate intake.

## **Chapter 5 (Protein; Food Safety)**

- Updated and expanded upon concepts of *epigenetics* and *nutrigenomics*, and discussion concerning personalized dietary prescriptions.
- Revised protein food intake recommendations based on the 2010 Dietary Guidelines for Americans, MyPlate food guidance system, and American College of Sports Medicine guidelines (for athletes).
- Revised recommendations regarding safe internal temperatures for meats based on new FightBAC® guidelines.
- Updated information on federal regulations related to mad cow disease, and included brief description of the FDA Food Safety Modernization Act passed in 2011.
- Updated many of the foodborne illness cases in the Food Safety Nutrition Matters to reflect outbreaks that occurred between 2009 and 2011.

### **Chapter 6 (Lipids; Nutrition and Cardiovascular Health)**

- Replaced previous Everybody Has a Story piece with one describing Nancy, a woman who has her gallbladder removed and endures somewhat troubling complications.
- Revised food intake recommendations (especially those related to omega-3 fatty acids) based on the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.
- Expanded section on Tangier disease to reflect current knowledge.
- Revised information concerning nutritional essentiality of docosahexaenoic acid (DHA) based on current knowledge.
- Revised statistics related to incidence and prevalence of cardiovascular disease.

### **Chapter 7 (Energy Metabolism; Alcohol, Health, and Disease)**

- Included new Everybody Has a Story chapter opener describing how dietary management of an inherited metabolic disease impacts daily food choices.
- Revised figure illustrating the process of enzymatic catalysis.
- Added new Focus on... feature concerning the use of therapeutic ketogenic diets to help control seizures in some children with epilepsy.
- Added a “You are here” illustration to provide students with an integrative view of the various pathways involved in energy metabolism.
- Added application of basic concepts of energy metabolism to topics such as alcohol metabolism and sports nutrition.

### **Chapter 8 (Energy Balance and Body Weight Regulation; Disordered Eating)**

- Expanded discussion pertaining to food cravings and aversions.
- Updated information regarding the regulatory role of ghrelin in hunger and satiety.
- Included overview of the National Association for Sports and Physical Education guidelines for physical education in schools.
- Expanded presentation of 2008 Physical Activity Guidelines for Americans.
- Updated information regarding obesity, inflammation, and chronic disease.
- Included new, updated tables summarizing feelings and behaviors associated with anorexia nervosa and bulimia nervosa.
- Expanded discussion of other dysfunctional eating patterns such as food neophobia, muscle dysmorphia, and night eating syndrome.
- Updated information and statistics regarding U.S. obesity trends.

### **Chapter 9 (Physical Activity and Health)**

- Included new Everybody Has a Story chapter opener describing the transformation of a sedentary middle-aged man into an Ironman® contender.
- Expanded text related to 2008 Physical Activity Guidelines for Americans and recommendations by the American College of Sports Medicine.
- Expanded and updated discussion of nutritional guidelines for athletes.

### **Chapter 10 (Water-Soluble Vitamins)**

- Updated information on vitamin and phytochemical function based on current knowledge.
- Expanded and updated discussion of folate fortification, its reported benefits, and its possible unintended consequences.
- Revised intake recommendations for water-soluble, vitamin-rich foods based on the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.

### **Chapter 11 (Fat-Soluble Vitamins; Nutrition and Cancer)**

- Updated information concerning recommended intakes of vitamin D based on new DRI values.
- Revised intake recommendations for fat-soluble vitamin-rich foods based on the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.
- Updated statistics related to cancer morbidity and mortality.

### **Chapter 12 (Major Minerals and Water; Nutrition and Bone Health)**

- Updated information concerning recommended intakes of calcium based on new DRI values.
- Revised intake recommendations for major mineral-rich foods based on the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.
- Updated discussion concerning dairy products, calcium, and weight maintenance to reflect current knowledge.
- Updated statistics related to osteoporosis morbidity and mortality.

### **Chapter 13 (Trace Minerals)**

- Introduced and described importance of hepcidin to iron homeostasis.
- Revised section on hereditary hemochromatosis to reflect current knowledge related to hepcidin production.
- Updated dietary intake recommendations related to mineral-rich whole-grain products based on the 2010 Dietary Guidelines for Americans and MyPlate food guidance system.

### **Chapter 14 (Life Cycle Nutrition; Food Security, Hunger, and Malnutrition)**

- Included new discussion related to pregnancy-induced hypertension, gestational diabetes, and dietary management of common pregnancy-related discomforts.
- Updated information pertaining to domestic nutrition-related legislation where appropriate.
- Updated DRI values for calcium and vitamin D throughout the life cycle.
- Introduced several important contemporary concepts such as food deserts and ready-to-use therapeutic foods.
- Updated information and statistics reflecting national and international food security and hunger.
- Replaced previously used CDC growth charts with currently recommended WHO growth charts for infants.
- Included data from Health, United States, 2010, which presents national trends in health statistics related to pregnancy outcomes.

## **Supplements**

- **Diet Analysis PLUS™**, a comprehensive diet assessment program, features the latest Dietary Reference Intakes and a database with over 20,000 foods that can be personalized with recipes. The program allows students to create personal profiles based on height, weight, age, gender, and activity level. A dynamic interface makes it easy for students to track the types and serving sizes of the foods they consume, from one day to 365 days. The program also allows students to generate reports that analyze their diets and see the health implications of their eating habits. New labs and assignments promote critical thinking.
- **WebTutor™**: Provides customizable, text-specific content that allows instructors to edit, reorganize, or delete content to meet their course needs. WebTutor offers quizzing, videos, animations, Pop-up Tutors, and test bank materials along with direct access to Diet Analysis PLUS, Global Nutrition Watch, and an interactive eBook.

- **CourseMate™:** Interested in a simple way to complement your text and course content with study and practice materials? Cengage Learning's *Nutrition* CourseMate brings course concepts to life with interactive learning, study, and exam preparation tools that support the printed textbook. Access an eBook, chapter-specific learning tools, including flashcards, quizzes, videos, and more in your *Nutrition* CourseMate, accessed through [www.cengagebrain.com](http://www.cengagebrain.com).
- The student **Study Guide**, which has been thoroughly updated for the third edition, provides a thorough review of each chapter and Nutrition Matters sections through practice tests, fill-in-the-blank summaries, key term matching sets, discussion questions, word problems, and figure identification exercises.
- **PowerLecture™ DVD:** This one-stop course preparation and presentation resource makes it easy for you to assemble, edit, publish, and present custom lectures for your course, using PowerPoint®. The PowerLecture includes PowerPoint® with stepped art, animations, BBC® video clips, the instructor's manual, the test bank, "clicker" content, and ExamView computerized testing.
- The **Instructor's Manual with Test Bank** features a robust assortment of knowledge- and application-level test items, the majority of which are multiple-choice format and organized by chapter section to facilitate selection. New to this edition are several food-focused class activities (with accompanying PowerPoint presentations) designed to engage students in making more healthful choices. Also provided are student assignment materials, enrichment activity suggestions, answer keys to the Everybody Has a Story questions, instructor guides to the in-text Diet Analysis PLUS Activities, and lecture outlines.
- The **Correlation Guide for Transparency Acetates** allows the transparencies to be easily mapped to the third edition of the text.

# ACKNOWLEDGMENTS

Revising a textbook is much like the process of spring cleaning. That is, to stay fresh, organized, and reinvigorated one must be insightful about what has proven worthy, and what can be discarded. Only when these decisions have been made and the “closet emptied” is there room for new elements to be woven into the existing tapestry of the book’s pages. That is exactly what we tried to do in the third edition of this book, and we certainly could not have done it alone. We are indeed fortunate to have teamed up with the experienced and skillful professionals at Wadsworth | Cengage Learning. Their guidance was invaluable, enabling us to transform our evolving vision into this quality textbook. We will forever be grateful for their encouragement and continued support throughout this entire process. Our special thanks are extended to our visionary leader Peggy Williams, who makes herself readily available to the entire team. Peggy not only understands the world of textbook publishing, but also has the necessary insights to approach projects from multiple perspectives—including those of students and faculty. Her tough-yet-tender tact has been perfect and appreciated. In the world of publishing, she is known for taking bold and progressive steps, and we are fortunate and honored to have her serve as captain of our team. Much appreciation also goes to Suzannah Alexander for her steadfast guidance throughout the entire revision process. From beginning to end, she was keenly watchful and aware of what everyone was doing and kept us moving forward in an orderly and synchronized fashion. Under her direction and guidance, we all arrived at the finish line together with a book of which we are all so proud. A special thank you is also extended to Carol Samet, who closely monitored every step of the production process to transform the various pieces of this book into a beautiful and meaningful whole. We are also grateful to Lynn Lustberg, for her endless and needed patience and assiduity; to the talented team of artists who continued to take our sometimes-sketchy ideas and transform them into artful illustrations; and to our creative photo researcher Josh Garvin who presented us with numerous excellent photo options from which to select. We think you will agree that these photos add

meaning and instructional depth to the many concepts related to nutritional science. We also appreciate his finding such a wonderful assortment of stunning photographs that illuminate the opening of each chapter. These visuals have greatly improved the book, making each page lively and engaging. Special thanks also go to Elesha Feldman, who again skillfully developed the instructor’s manual, test bank, and student study guide that accompany this text; Sean Cronin, for providing his support and assistance; Laura McGinn, for her continued efforts in coordinating the marketing and promotion of the third edition; and Miriam Myers who has created the media supplements.

We are also incredibly grateful to the professors who provided their expertise in preparing various supplements: thank you to Jennifer Bueche and Carolyn J. Haessig La Potin of State University of New York College at Oneonta for preparing the test bank and creating new activities for the instructor’s manual; to Susan E. Helm of Pepperdine University for writing the study guide and contributing to the instructor’s manual; and to Lisa Esposito, consulting dietitian, and Prithiva Chanmugam and Judy Myhand of Louisiana State University for their skilled contributions to the instructor’s manual. Finally, many thanks to Mithia Mukutmoni of Sierra College for preparing the Diet Analysis PLUS Activities that appear at the end of most chapters and to Judy Myhand for her suggestions.

We are also thankful for the many expert reviewers who took the time to read each chapter and provide invaluable feedback in terms of content and clarity. We certainly could not have produced an up-to-date textbook without this critical input. And we would like to extend a heartfelt thank you to those who allowed us to share their interesting life stories with the readers of this textbook. These stories, as featured in the new Everybody Has a Story pieces, would not be possible without these people’s willingness to discuss the challenges they face on a daily basis. We all have a great deal to learn from their experiences and triumphs. Last, to all our friends, families, and colleagues who helped in more ways than they will ever know: Thank you for being fellow travelers on this ever-important journey.

THIRD EDITION

# Nutritional Sciences

FROM FUNDAMENTALS TO FOOD

# The Science of Nutrition

# 1 CHAPTER

*Let thy food be thy medicine and thy medicine be thy food.*

—Hippocrates (460–364 B.C.)

Life would not be possible without the nourishment of food. Indeed, our quality of life depends greatly on which foods we choose to eat, and experts unanimously agree that the foods we eat can greatly influence both our immediate health and our risk of disease as we age. Hopefully, you are reading this textbook because you are interested in making sure your diet is as healthful as possible. The information you learn in this course—if you apply it to your life—will be beneficial.

Perhaps the first questions you should ask yourself as you embark upon this journey of learning are “*Do I choose my foods wisely?*” and “*What changes might I make to ensure optimal nutrition and a long and healthy life?*” To answer these questions, you must first understand what nutrients are and how your body uses them to maintain and fuel all of its complex physiologic processes. In other words, you must understand the science of nutrition.

Science is powerful. It helps explain our world, makes it a better place to live, and contributes to good health. Yet scientific progress almost always generates considerable debate. Not surprisingly, nutritional discoveries that have helped prevent and cure diseases are often met with both excitement and skepticism. For example, one day you may read in a newspaper, “Vitamin A decreases risk of heart disease.” Later, another headline claims, “Vitamin A increases risk for cancer.” Likewise, an article that says, “You should eat more fish” may be followed by one that asserts, “Fish contains dangerous heavy metals.” While nutritional science offers great hope for improving health, you are likely well aware that it also generates controversy.

There is no argument, however, that nutrition and its impact on human health are of crucial importance. Nutritional deficiencies have always posed major health challenges worldwide, but today nutritional abundance and imbalance also contribute to many of our health problems.<sup>1</sup> Poor dietary choices you make now very well might play a major role in predisposing you to obesity, cancer, heart disease, osteoporosis, and type 2 diabetes later in your life.<sup>2</sup> This chapter discusses the fundamental concepts necessary to understand how good nutrition is basic to your health. You will also learn how scientists study nutrition. With this knowledge, you will be able to make sound decisions about selecting a healthy diet—based on scientific reason, not rumor—for years to come.

## Chapter Outline

### Everybody Has a Story: Choosing Nutrition as a Career Path

What Do We Mean by “Nutrition”?

**FOCUS ON FOOD:** Understanding What Is Meant by “Organic Foods”

What Are the Major Nutrient Classes?

How Do Foods Provide Energy?

How Is Nutrition Research Conducted?

Are All Nutrition Claims Believable?

Nutrition and Health: What Is the Connection?

**FOCUS ON DIET AND HEALTH:** Industrialization, Population Growth, and the Nutrition Transition

## EVERYBODY HAS A STORY

# Choosing Nutrition as a Career Path

Katherine has always enjoyed good food and the pleasures of eating. But she never imagined that she would pursue a career in nutrition. However, when she recalls her experiences as an overweight child competing at the local swimming club, she realizes that she has long understood the importance of a healthy diet for both physical and mental health. Science was not one of Katherine's passions as she went through her high school years. Instead, she was much more interested in music and tennis, and Katherine was emphatic that she would do nothing related to science, partly because she found her high school science laboratories "contrived and not useful to her daily experience." She instead entered the University of Idaho as an elementary education major and planned to pursue a career as a teacher in the public schools. To fulfill her general education requirement in biology, however, Katherine enrolled in an introductory microbiology class during her first year of studies—not because she was at all interested in the subject, but because her friends reassured her that the professor was engaging and fair. Much to her surprise, Katherine rapidly learned that college-level science was very different from what she had experienced in high school. She understood, for the first time, that many scientific disciplines were incredibly applicable to her own life as well as the health and well-being of society. Of exceptional interest in her microbiology course was the section on foodborne illness because it emphasized how a person's dietary choices can immediately and profoundly impact his or her health. Within a few months, Katherine had switched her major to dietetics and was working in a nutrition research laboratory on campus. She soon discovered that the science of nutrition is not only compelling, challenging, and useful, but that she thoroughly enjoyed the basic work required to carry out nutrition experiments and analyze their results. Katherine is now a graduate student working on her doctorate in nutrition at

the University of Idaho. Her graduate research focuses on how a breastfeeding woman's diet influences the composition of her milk, and she has presented her work both nationally and internationally. For Katherine, the discovery that science—in particular, nutritional science—was her career calling came somewhat late in her undergraduate career. And it came as a complete surprise. Indeed, keeping one's options open during college and exploring various disciplines of study are some of the most important tasks of any college student. Sometimes one class can change your life.

### Critical Thinking: Katherine's Story

Why are you taking this nutrition class, and what are your personal goals for what you will learn? Are there specific issues that are of special interest to you as you embark upon your study of nutrition? Why are you especially interested in these topics? Has nutrition been an interest of yours for many years, or has some situation or experience made you particularly interested in learning more about it?

# What Do We Mean by “Nutrition”?

Perhaps the first question you may have is what the term *nutrition* actually means. The term **nutrition** refers to the science of how living organisms obtain and use food to support all the processes required for their existence, and the study of nutrition incorporates a wide variety of scientific disciplines. Some nutritionists, for example, are interested in food production and availability, whereas others conduct research on why people choose to eat certain foods. Still others investigate the relationships between diet and heart disease, how nutrition can influence athletic performance, or whether the composition of our meals can influence weight management. Indeed, the field of nutrition encompasses a broad array of important scientific and cultural aspects.

As such, scientists who study nutrition, called **nutritional scientists**, can be found in many disciplines, including immunology, medicine, genetics, biology, physiology, biochemistry, education, psychology, and sociology, as well as nutrition. **Dietitians** are nutrition professionals who help people make dietary changes and food choices to support a healthy lifestyle. A dietitian has the credential of “RD,” which stands for *registered dietitian*. Many dietitians are also involved in research. Thus the science of nutrition, collectively called the **nutritional sciences**, reflects a broad spectrum of academic and social disciplines.

## NUTRIENTS SUPPORT ALL WE DO

But what are nutrients, and why do we need them? **Nutrients** have traditionally been defined as substances in foods required or used by the body for at least one of the following: energy, structure, or regulation of chemical reactions. For example, carbohydrates supply energy to fuel your body’s activities, calcium and phosphorus are important building blocks of your teeth and bones, and many of the vitamins are essential for chemical reactions such as those needed to protect your cells from the damaging effects of excessive sunlight and pollution. There are also many other substances present in food that appear to have health benefits such as decreasing risks for cancer and heart disease. Scores of these compounds have only recently been discovered and are therefore less understood than the “traditional” nutrients. Clearly, the definition of what is a nutrient is evolving, and the list of established nutrients will likely expand as researchers learn more about how the thousands of substances found in foods can promote health and well-being.

## FOODS CONTAIN NUTRIENTS AND NONNUTRIENTS

You may be surprised to learn that not all compounds in food are nutrients. To convince yourself of this, you need only examine almost any food label. Many of these compounds found in foods, such as artificial colors, are not nutrients because they are not needed to support basic functions in your body. In general, scientists classify nutrients into six categories based on their chemical structure and composition: carbohydrates, proteins, lipids, water, minerals, and vitamins. Scientists also categorize nutrients and foods in other ways, and some of these classifications are described next.

**Essential, Nonessential, and Conditionally Essential Nutrients** Although our bodies can use all the nutrients in foods, we only need to consume some of them. These nutrients are referred to as the **essential nutrients**. Essential nutrients

The dietary choices you make today can influence your health for years to come.

---

**nutrition** The science of how living organisms obtain and use food to support processes required for life.

**nutritional scientist** A person who conducts and/or evaluates nutrition-related research.

**dietitian** A nutritionist who helps people make healthy dietary choices.

**nutritional sciences** A broad spectrum of academic and social disciplines related to nutrition.

**nutrient** A substance in foods used by the body for energy, maintenance of body structures, or regulation of chemical processes.

**essential nutrient** A substance that must be obtained from the diet, because the body needs it and cannot make it in required amounts.

must be obtained from your diet, because your body needs them and either cannot make them at all or cannot make them in adequate amounts. **Non-essential nutrients** are those your body can make in amounts needed to satisfy its physiological requirements. Hence, you do not actually need to consume nonessential nutrients. Most foods contain a mixture of essential and nonessential nutrients. For example, milk contains a variety of essential vitamins and minerals (such as vitamin A and calcium) as well as nonessential nutrients (such as cholesterol).

However, there are situations when a normally nonessential nutrient can become essential. During these times, the nutrient is called a **conditionally essential nutrient**. For example, older children and adults must obtain two essential lipids through the diet, whereas babies are thought to require at least four, which they are unable to make. The additional lipids are therefore “conditionally essential” during early life. Certain diseases also cause normally nonessential nutrients to become conditionally essential. You will learn about some of these in later chapters.

**Macronutrients versus Micronutrients** Nutrients can also be classified on the basis of how much of them we require from *our* diet. (Figure 1.1). Water, carbohydrates, proteins, and lipids are called **macronutrients**, because they are needed in large quantities (over a gram each day). Vitamins and minerals are called **micronutrients**, because we need only very small amounts of them (often micrograms or milligrams each day). For example, a typical adult requires about 2,726 pounds (1,239 kilograms) of the macronutrient protein over the course of a lifetime but only about 0.3 pounds (0.14 kilograms) of the micronutrient iron.

“Certified organic” foods can be identified by this seal.

**nonessential nutrient** A substance found in food and used by the body to promote health but not required to be consumed in the diet.

**conditionally essential nutrient** Normally nonessential nutrient that, under certain circumstances, becomes essential.

**macronutrients** Nutrients that we need to consume in relatively large quantities (>1 gram/day).

**micronutrients** Nutrients that we need to consume in relatively small quantities (<1 gram/day).

**organic compound** A substance that contains carbon-carbon bonds or carbon-hydrogen bonds.

**inorganic compound** A substance that does not contain carbon-carbon bonds or carbon-hydrogen bonds.

**certified organic foods** Plant and animal foods that have been grown, harvested, and processed without conventional pesticides, fertilizers, growth promoters, bioengineering, or ionizing radiation.

## ORGANIC NUTRIENTS ARE DIFFERENT FROM ORGANIC FOODS

We can also classify nutrients as being organic or inorganic. By definition, molecules that contain carbon atoms bonded to hydrogen atoms or other carbon atoms are called **organic compounds**. Carbohydrates, proteins, lipids, and vitamins are chemically organic nutrients. Water and minerals are **inorganic** because they do not contain carbon-carbon or carbon-hydrogen bonds. In this way, all foods are considered organic—at least in the chemical sense of the term. However, the term *organic* also has an additional and very different meaning when it is used to describe how a food (plant or animal) is grown and harvested. When a food is labeled “**Certified Organic**,” it has been grown and processed according to U.S. Department of Agriculture (USDA) national organic standards. For example, a farmer cannot use conventional pesticides and herbicides on organically grown crops. You can find out what percentage of organic ingredients a product has by reading its food label (Figure 1.2) and learn more about organic foods in the Focus on Food feature.

**FIGURE 1.1** **Micronutrients versus Macronutrients** Vitamins and minerals are micronutrients, whereas water, carbohydrates, proteins, and lipids are macronutrients.

## FOCUS ON FOOD

# Understanding What Is Meant by “Organic Foods”

A chemist understands the term organic to generally mean a carbon-containing compound. However, the food industry uses the term *organic* to mean something quite different. In 1992, the U.S. federal government established the National Organic Standards Board (NOSB) to help develop standards for substances to be used (or not used) in organic food production. To learn more about these standards, you can visit the USDA's National Organic Program website at <http://www.ams.usda.gov/AMSv1.0/nop.htm>. The NOSB developed the following definition: “*organic agriculture is an ecological production management system that promotes and enhances biodiversity, biological cycles and soil biological activity ... based on management practices that restore, maintain, and enhance ecological harmony.*” As such, an organic food must be produced, grown, and harvested without the use of most conventional pesticides, fertilizers made with synthetic ingredients, bio-engineering, or ionizing radiation. Furthermore, organic meat, eggs, and dairy products must come from livestock raised without the use of growth-promoting hormones and antibiotics.

Foods with the USDA organic seal labeled as being “100% organic” must have at least 95% organically produced ingredients. Foods labeled as being “organic” must have at least 70% organic ingredients. Products with less than 70% organic ingredients may list specific organically produced ingredients on the side panel of the package but may not make any organic claims on the front of the package (see Figure 1.2).

The USDA makes no claims that organically produced food is safer or more nutritious than conventionally produced food, and the labeling of foods as “organic” is not meant to suggest enhanced nutritional quality or food safety. In fact, there is mixed evidence that organic foods are nutritionally superior to conventional foods.<sup>3</sup> Rather, the difference between organic foods and conventionally produced foods largely involves the methods used to grow, handle, and process them. Whether these alternative agricultural practices promote enhanced environmental integrity and balance is an area of active debate.

## PHYTOCHEMICALS, ZOONUTRIENTS, AND FUNCTIONAL FOODS

As scientists learn more about the relationship between diet and health, they are discovering that, in addition to the traditional or established macronutrients and micronutrients, foods also contain other substances that influence our health. When health-promoting compounds such as these are found in plants, they are called phytochemicals. Others, called zoonutrients, are found in animal foods. Although phytochemicals and zoonutrients are not considered to be nutrients by many nutritionists, researchers think that many are

FIGURE 1.2 Understanding Food Labels of Organic Products

beneficial to health. As scientists learn more about these compounds, some of them may be reclassified as nutrients in the future.

**Phytochemicals: Beneficial Substances from Plant Foods** Although they are not nutrients, **phytochemicals** (also called phytonutrients) are substances found in plants that may help reduce the risk for developing certain diseases.<sup>4</sup> In fact, many “health claims” on food packaging labels refer not to traditional nutrients but instead to phytochemicals. For example, consuming phytochemicals found in tomatoes and garlic may decrease your risk of cancer. Grapes and wine contain phytochemicals that may reduce the risk of heart disease. You will learn more about these and other phytochemicals throughout this book.

**Zoonutrients: Beneficial Substances from Animal Foods** Like phytochemicals, which are found in plants, **zoonutrients** (also called zoochemicals) are compounds present in animal foods that provide health benefits beyond the provision of traditional nutrients and energy.<sup>5</sup> Examples of zoonutrients include a variety of nonessential lipids, found in fish and dairy products, that are thought to decrease your risk for heart disease. Another example of a zoonutrient is found in the larval jelly produced by honeybees. This substance is antimicrobial and may reduce the risk of infection.<sup>6</sup>

**Functional Foods May Offer Important Health Benefits** **Functional foods** are those that may promote optimal health, above and beyond simply helping the body meet its basic nutritional needs.<sup>7</sup> Functional foods contain (1) enhanced amounts of traditional nutrients, (2) phytochemicals, and/or (3) zoonutrients. For example, soy milk is considered a functional food because it contains phytochemicals thought to decrease risk for some cancers. Other examples are conventional cow’s milk, which has been shown to be rich in zoonutrients that may lower your risks of cancer and high blood pressure. Although consuming functional foods may improve your health, the mechanisms by which this occurs are often poorly understood.

Why might scientists consider this plate of spaghetti and glass of wine functional foods?

## What Are the Major Nutrient Classes?

Nutrients are needed by your body to provide structure, regulate chemical reactions (metabolism), and supply energy. Protein, for example, is important for providing the basic structure of muscles, many vitamins help regulate the hundreds of chemical reactions that occur in your body, and dietary fats provide an important source of energy needed to power your body’s activities. Each class of nutrients consists of many different compounds and contributes to most of these functions in one way or another. You will learn more about each of the nutrient classes in upcoming chapters.

**phytochemical** (also called phytonutrient) (phy – to – CHEM – i – cal) A substance found in plants and thought to benefit human health above and beyond the provision of essential nutrients and energy.

**zoonutrient** (zo – o – NU – tri – ent) A substance found in animal foods and thought to benefit human health above and beyond the provision of essential nutrients and energy.

**functional food** A food that contains enhanced levels of an essential nutrient, phytochemical, or zoonutrient and thought to benefit human health.

### CARBOHYDRATES ARE VITAL FOR ENERGY AND REGULATORY ROLES

Carbohydrates consist of carbon, hydrogen, and oxygen atoms and serve a variety of functions in the body. There are many different types of carbohydrates; for example, those found in starchy foods like rice and pasta are quite different from those found in fruits and sweet desserts. Of the various carbohydrates that exist, perhaps the most important is glucose. Indeed, most cells use glucose as their primary source of energy. Your body uses carbohydrates for many other purposes as well. For instance, some are needed to make the genetic material (DNA) in cells. Other carbohydrates such as

dietary fiber play roles in maintaining the health of your digestive system and may help decrease your risk of certain conditions, including heart disease and type 2 diabetes. Carbohydrates are also important structural and regulatory components of the membranes that surround the millions of cells in your body.

## PROTEINS MAKE UP MUSCLES AND ARE IMPORTANT FOR ENERGY AND REGULATION

Protein is abundant in many foods, including meat, legumes (such as dried peas), and some cereal products. Although most proteins consist primarily of carbon, oxygen, nitrogen, and hydrogen atoms, some also contain sulfur or selenium atoms. The thousands of proteins in your body have numerous roles in addition to serving as a source of energy. Proteins also comprise the major structural material in various parts of your body, including muscle, bone, and skin. Proteins allow us to move, support our complex internal communication systems, keep us healthy by their roles in the immune system (which protects against infection and disease), and regulate many of the chemical reactions needed for life.

## LIPIDS ARE MORE THAN ABUNDANT ENERGY SOURCES

Lipids, which include a variety of oils and fats found in foods and the body, generally consist of carbon, oxygen, and hydrogen atoms. They provide large amounts of energy, are important for the structure of cell membranes, and are needed for your nervous and reproductive systems to function properly. Lipids also regulate a variety of cellular processes. Many foods contain lipids, although the types found in plant-based products such as corn oil and nuts are typically quite different from those found in animal-based foods such as meat, fish, eggs, and milk.

## WATER IS THE ESSENCE OF LIFE ITSELF

Without water, there would be no life. Indeed, water—which is made of oxygen and hydrogen atoms—makes up approximately 60% of your total body weight. Without exception, you consume water every day, be it in beverages or in the foods you eat. The functions of water are varied and vital, including transport of nutrients, gases, and waste products; serving as a medium in which chemical reactions occur; and involvement in many chemical reactions. Water is also important in regulating body temperature and protecting your internal organs from damage.

## VITAMINS REGULATE REACTIONS AND PROMOTE GROWTH AND DEVELOPMENT

Vitamins have a variety of chemical structures and are abundant in most naturally occurring foods—especially fruits, vegetables, and grains. Although they all contain carbon, oxygen, and hydrogen atoms, some vitamins also
