Contents

Preface	xiii		
About the Authors	xv		
1: What Is Personality Psychology?	1		
1.1: Defining Personality	1		
1.1.1: Why Use the Word <i>Personality</i> as a Concept?	1		
1.1.2: A Working Definition	2		
1.1.3: Two Fundamental Themes in Personality Psychology	2		
1.2: Theory in Personality Psychology	3		
1.2.1: What Do Theories Do?	3		
1.2.2: The Role of Research in Evaluating Theories	3		
1.2.3: What Else Makes a Theory Good?	4		
1.3: Perspectives on Personality	5		
1.3.1: Perspectives to Be Examined Here	5		
1.3.2: Perspectives Reconsidered	6		
1.4: Organization within Chapters	6		
1.4.1: Assessment	6		
1.4.2: Problems in Behavior, and Behavior Change	7		
Summary: What Is Personality Psychology?	7		
2: Methods in the Study of Personality	9		
2.1: Gathering Information	9		
2.1.1: Observe Yourself and Observe Others	9		
2.1.2: Depth Through Case Studies	9		
2.1.3: Depth from Experience Sampling	10		
2.1.4: Seeking Generality by Studying Many People	10		
2.2: Establishing Relationships among Variables	11		
2.2.1: Correlation between Variables	12		
2.2.2: Two Kinds of Significance	14		
2.2.3: Causality and a Limitation on Inference	14		
2.2.4: Experimental Research	15		
2.2.5: Recognizing Types of Studies	16		
Box 2.1 Correlations in the News	17		
2.2.6: What Kind of Research Is Best?	17		
2.2.7: Experimental Personality Research and Multifactor Studies	17		
2.2.8: Reading Figures from Multifactor Research	18		
Summary: Methods in the Study of Personality	19		
3: Issues in Personality Assessment	20		
3.1: Sources of Information	20		
3.1.1: Observer Ratings	20		
Box 3.1 What Does Your Stuff Say about You?	21		
3.1.2: Self-Reports	21		
3.1.3: Implicit Assessment	21		
3.1.4: Subjective versus Objective Measures	22		
3.2: Reliability of Measurement	22		
3.2.1: Internal Consistency	22		
3.2.2: Inter-Rater Reliability	23		
Box 3.2 A New Approach to Assessment: Item Response Theory	23		
3.2.3: Stability across Time	24		
3.3: Validity of Measurement	24		
3.3.1: Construct Validity	25		
3.3.2: Criterion Validity	25		
3.3.3: Convergent Validity	26		
3.3.4: Discriminant Validity	26		
3.3.5: Face Validity	26		
3.3.6: Culture and Validity	26		
3.3.7: Response Sets and Loss of Validity	27		
3.4: Two Rationales behind the Development of Assessment Devices	28		
3.4.1: Rational or Theoretical Approach	28		
3.4.2: Empirical Approaches	28		
3.5: Never-Ending Search for Better Assessment	29		
Summary: Issues in Personality Assessment	29		
4: The Trait Perspective	30		
4.1: Types and Traits	30		
4.1.1: Nomothetic and Idiographic Views of Traits	31		
4.2: What Traits Matter?	31		
4.2.1: Factor Analysis	31		
Box 4.1 A Closer Look at Factor Analysis	32		
4.2.2: Let Reality Reveal Itself	33		
4.2.3: Start from a Theory	33		
4.2.4: The Interpersonal Circle as Another Theoretical Starting Point	35		
4.3: The Five-Factor Model	35		
4.3.1: What <i>Are</i> the Five Factors?	36		
4.4: Reflections of the Five Factors in Behavior	37		
4.4.1: Extraversion and Agreeableness	37		
4.4.2: Conscientiousness, Openness, and Neuroticism	38		
4.5: Relations to Earlier Trait Models	39		
4.6: Other Variations	39		
4.6.1: Expanding and Condensing the Five-Factor Model	40		
4.6.2: Are Superordinate Traits the Best Level to Use?	40		
4.7: Traits, Situations, and Interactionism	40		
4.7.1: Is Behavior Actually Traitlike?	41		
Box 4.2 How Stable Is Personality over Long Periods?	41		

4.7.2: Situationism	41	5.9.1: The Need for Power and Alcohol Abuse	64
4.7.3: Interactionism	41	5.9.2: Focusing On and Changing Motivation	64
4.7.4: Other Aspects of Interactionism	43	5.10: Problems and Prospects for the Motive Perspective	65
4.7.5: Was the Problem Ever Really as Bad as It Seemed?	43	Summary: The Motive Perspective	65
4.8: Interactionism as Context-Dependent Expression of Personality	43	6: Genetics, Evolution, and Personality	67
4.8.1: Fitting the Pieces Together	44	6.1: Determining Genetic Influence on Personality	67
Box 4.3 Theoretical Issue: What Really Is a Trait?	45	Box 6.1 Early Biological Views: Physique and Personality	68
4.9: Assessment from the Trait Perspective	46	6.1.1: Twin Study Method	68
4.9.1: Comparing Individuals Using Personality Profiles	46	6.1.2: Adoption Research	69
4.10: Problems in Behavior, and Behavior Change, from the Trait Perspective	47	6.2: What Personality Qualities Are Genetically Influenced?	69
4.10.1: The Five-Factor Model and Personality Disorders	47	6.2.1: Temperaments	69
4.10.2: Interactionism in Behavior Problems	47	6.2.2: More Recent Views of Temperaments	70
4.10.3: Behavior Change	48	6.2.3: Inheritance of Traits	70
4.11: Problems and Prospects for the Trait Perspective	48	6.2.4: Temperaments and the Five-Factor Model	70
Summary: The Trait Perspective	49	6.2.5: How Distinct Are the Genetics of Other Qualities?	71
5: The Motive Perspective	50	6.2.6: Environmental Influences	71
5.1: Basic Theoretical Elements	51	6.3: Complications in Behavioral Genetics	72
5.1.1: Needs	51	6.3.1: Heritability Varies with the Environment	72
5.1.2: Motives	51	6.3.2: Correlations between Genetic and Environmental Influences	72
5.1.3: Press	52	6.4: Molecular Genetics and Genomics	73
5.2: Needs, Motives, and Personality	52	6.4.1: Gene-by-Environment Interactions	74
5.2.1: Motive States and Motive Dispositions	52	6.4.2: Environmental Effects on Gene Expression	74
5.2.2: Measuring Motives Using the Thematic Apperception Test	53	6.5: Evolution and Human Behavior	75
5.3: Studies of Specific Dispositional Motives	53	6.5.1: Sociobiology and Evolutionary Psychology	75
5.3.1: Need for Achievement	53	Box 6.2 Theoretical Issue: Universal Adaptations and Why There Are Individual Differences	75
5.3.2: Need for Power	55	6.5.2: Genetic Similarity and Attraction	76
5.3.3: Need for Affiliation	57	6.5.3: Avoidance of Incest	77
5.3.4: Need for Intimacy	57	6.5.4: Mate Selection and Competition for Mates	77
5.3.5: Patterned Needs	58	6.5.5: Mate Retention and Other Issues	79
5.4: Implicit and Self-Attributed Motives	59	6.5.6: Aggression and the Young Male Syndrome	80
5.4.1: Incentive Value	59	6.6: Assessment from the Genetic and Evolutionary Perspective	81
5.4.2: Implicit Motives Are Different from Self-Attributed Motives	59	6.7: Problems in Behavior, and Behavior Change, from the Genetic and Evolutionary Perspective	81
5.5: Approach and Avoidance Motives	60	6.7.1: Schizophrenia and Bipolar Disorder	81
5.5.1: Approach and Avoidance in Other Motives	61	Box 6.3 Living in a Postgenomic World	81
5.6: Motives and the Five-Factor Trait Model	61	6.7.2: Substance Use and Antisocial Behavior	82
5.6.1: Traits and Motives as Distinct and Complementary	61	6.7.3: Evolution and Problems in Behavior	83
5.7: Personology and the Study of Narratives	62	6.7.4: How Much Behavior Change Is Possible?	83
5.8: Assessment from the Motive Perspective	62	6.8: Problems and Prospects for the Genetic and Evolutionary Perspective	83
Box 5.1 The Process Underlying the TAT or the PSE	63	Summary: Genetics, Evolution, and Personality	84
5.8.1: Other Implicit Assessments	63	7: Biological Processes and Personality	86
5.9: Problems in Behavior, and Behavior Change, from the Motive Perspective	64	7.1: Eysenck's Early Views on Brain Functions	87
		7.2: Incentive Approach System	87

7.2.1: Behavioral Approach	87	8.3.1: Id	107
7.2.2: More Issues in Approach	88	8.3.2: Ego	107
7.2.3: Neurotransmitters and the Approach System	88	8.3.3: Superego	108
7.3: Behavioral Avoidance, or Withdrawal, System	89	8.3.4: Balancing the Forces	108
7.3.1: Neurotransmitters and the Avoidance System	90	8.4: The Drives of Personality	109
7.4: Relating Approach and Avoidance Systems to Traits and Temperaments	90	Box 8.2 Distortion in Psychoanalytic Ideas by Translation and Cultural Distance	109
7.4.1: The Role of Sociability	90	8.4.1: Life and Death Instincts	110
7.4.2: The Role of Impulsivity	91	8.4.2: Catharsis	110
7.5: Sensation Seeking, Constraint, and Effortful Control	91	8.5: Anxiety and Mechanisms of Defense	111
7.5.1: Sensation Seeking	91	8.5.1: Repression	111
7.5.2: Relating Sensation Seeking to Traits and Temperaments	92	Box 8.3 Unintended Effects of Thought Suppression	112
7.5.3: Another Determinant of Impulse and Restraint	92	8.5.2: Denial	112
7.5.4: Neurotransmitters and Impulse versus Constraint	93	8.5.3: Projection	112
Box 7.1 Research Question: How Do You Measure Neurotransmitter Function?	93	8.5.4: Rationalization and Intellectualization	113
7.6: Hormones and Personality	94	8.5.5: Displacement and Sublimation	113
7.6.1: Hormones, the Body, and the Brain	94	8.5.6: Research on Defenses	114
7.6.2: Early Hormonal Exposure and Behavior	95	8.6: Psychosexual Development	114
7.6.3: Testosterone and Adult Personality	96	8.6.1: The Oral Stage	114
Box 7.2 Steroids: An Unintended Path to Aggression	97	8.6.2: The Anal Stage	115
7.6.4: Cycle of Testosterone and Action	98	8.6.3: The Phallic Stage	116
7.6.5: Testosterone, Dominance, and Evolutionary Psychology	98	Box 8.4 The Theorist and the Theory: Freud's Own Oedipal Crisis	117
7.6.6: Responding to Stress	99	8.6.4: The Latency Period	117
7.7: Assessment from the Biological Process Perspective	100	8.6.5: The Genital Stage	117
7.7.1: Electroencephalograms	100	8.7: Exposing the Unconscious	117
7.7.2: Neuroimaging	100	8.7.1: The Psychopathology of Everyday Life	118
7.8: Problems in Behavior, and Behavior Change, from the Biological Process Perspective	101	8.7.2: Dreams	119
7.8.1: Biological Bases of Anxiety and Depression	101	8.8: Assessment from the Psychoanalytic Perspective	119
7.8.2: Biological Bases of Antisocial Personality	101	8.9: Problems in Behavior, and Behavior Change, from the Psychoanalytic Perspective	120
7.8.3: Biological Therapies	102	8.9.1: Origins of Problems	120
7.9: Problems and Prospects for the Biological Process Perspective	103	8.9.2: Behavior Change	120
Summary: Biological Processes and Personality	103	Box 8.5 Repression, Disclosure, and Physical Health	121
8: The Psychoanalytic Perspective	105	8.9.3: Does Psychoanalytic Therapy Work?	121
Box 8.1 Was Freud Really the Sole Creator of Psychoanalysis?	106	8.10: Problems and Prospects for the Psychoanalytic Perspective	122
8.1: Basic Themes	106	Summary: The Psychoanalytic Perspective	123
8.2: The Topographical Model of the Mind	106	9: Psychosocial Theories	125
8.3: The Structural Model of Personality	107	9.1: Object Relations Theories	125
		Box 9.1 Ego Psychology	126
		9.1.1: Self Psychology	127
		9.2: Attachment Theory and Personality	127
		9.2.1: Attachment Patterns in Adults	129
		9.2.2: How Many Patterns?	129
		Box 9.2 How Do You Measure Adult Attachment?	130
		9.2.3: Stability and Specificity	130
		9.2.4: Other Reflections of Adult Attachment	131

9.2.5: Attachment Patterns and the Five-Factor Model	132	Box 10.3 Modeling and Delay of Gratification	153
Box 9.3 How Impactful Is Early Childhood Adversity?	133	10.3.4: What Really Is Reinforcement?	153
9.3: Erikson’s Theory of Psychosocial Development	133	10.3.5: Efficacy Expectancies	153
9.3.1: Ego Identity, Competence, and the Experience of Crisis	133	10.3.6: Role of Awareness	154
9.3.2: Infancy	134	10.4: Observational Learning	154
9.3.3: Early Childhood	135	10.4.1: Attention and Retention	154
9.3.4: Preschool	135	10.4.2: Production	155
9.3.5: School Age	136	10.4.3: Acquisition versus Performance	155
9.3.6: Adolescence	136	10.5: Modeling of Aggression and the Issue of Media Violence	156
Box 9.4 The Theorist and the Theory: Erikson’s Lifelong Search for Identity	137	10.6: Assessment from the Learning Perspective	157
9.3.7: Young Adulthood	137	10.6.1: Conditioning-Based Approaches	157
9.3.8: Adulthood	138	10.6.2: Social–Cognitive Approaches	157
9.3.9: Old Age	139	10.7: Problems in Behavior, and Behavior Change, from the Learning Perspective	158
9.3.10: The Epigenetic Principle	139	10.7.1: Classical Conditioning of Emotional Responses	158
9.3.11: Identity as Life Story	139	10.7.2: Conditioning and Context	158
9.3.12: Linking Erikson’s Theory to Other Psychosocial Theories	140	10.7.3: Instrumental Conditioning and Maladaptive Behaviors	159
9.4: Assessment from the Psychosocial Perspective	140	10.7.4: Social–Cognitive Approaches	159
9.4.1: Object Relations, Attachment, and the Focus of Assessment	140	10.7.5: Modeling-Based Therapy for Skill Deficits	160
9.4.2: Play in Assessment	140	10.7.6: Modeling and Responses to Fear	160
9.5: Problems in Behavior, and Behavior Change, from the Psychosocial Perspective	141	10.7.7: Therapeutic Changes in Efficacy Expectancy	161
9.5.1: Narcissism as a Disorder of Personality	141	10.8: Problems and Prospects for the Learning Perspective	161
9.5.2: Attachment and Depression	141	Summary: The Learning Perspective	162
9.5.3: Behavior Change	141	11: Self-Actualization and Self-Determination	164
9.6: Problems and Prospects for the Psychosocial Perspective	142	11.1: Self-Actualization	165
Summary: Psychosocial Theories	142	11.1.1: The Need for Positive Regard	165
10: The Learning Perspective	144	11.1.2: Contingent Self-Worth	166
10.1: Classical Conditioning	144	11.2: Self-Determination	166
10.1.1: Basic Elements	145	11.2.1: Introjection and Identification	167
10.1.2: Discrimination, Generalization, and Extinction in Classical Conditioning	146	11.2.2: Need for Relatedness	168
Box 10.1 What’s Going On in Classical Conditioning?	146	11.2.3: Self-Concordance	168
10.1.3: Emotional Conditioning	147	11.2.4: Free Will	168
Box 10.2 Classical Conditioning and Attitudes	148	11.3: The Self and Processes of Defense	169
10.2: Instrumental Conditioning	148	Box 11.1 How Can You Manage Two Kinds of Congruence Simultaneously?	169
10.2.1: The Law of Effect	148	11.3.1: Incongruity, Disorganization, and Defense	170
10.2.2: Reinforcement and Punishment	149	11.3.2: Self-Esteem Maintenance and Enhancement	170
10.2.3: Discrimination, Generalization, and Extinction in Instrumental Conditioning	149	11.3.3: Self-Handicapping	170
10.2.4: Schedules of Reinforcement	150	11.3.4: Stereotype Threat	171
10.2.5: Reinforcement of Qualities of Behavior	151	11.4: Self-Actualization and Maslow’s Hierarchy of Motives	171
10.3: Social and Cognitive Variations	151	Box 11.2 The Theorist and the Theory: Abraham Maslow’s Focus on the Positive	172
10.3.1: Social Reinforcement	151	11.4.1: Characteristics of Frequent Self-Actualizers	173
10.3.2: Vicarious Emotional Arousal	152	11.4.2: Peak Experiences	174
10.3.3: Vicarious Reinforcement	152	11.5: Existential Psychology	174

11.5.1: The Existential Dilemma	175	12.6.2: Depressive Self-Schemas	198
11.5.2: Emptiness	175	12.6.3: Cognitive Therapy	199
11.5.3: Terror Management	175	12.7: Problems and Prospects for the Cognitive Perspective	199
11.6: Assessment from the Self-Actualization and Self-Determination Perspective	177	Summary: The Cognitive Perspective	200
11.6.1: Interviews in Assessment	177	13: The Self-Regulation Perspective	201
Box 11.3 Self-Actualization and Your Life	177	13.1: From Cognition to Behavior	201
11.6.2: Measuring the Self-Concept by Q-Sort	178	13.1.1: Intentions	202
11.6.3: Measuring Self-Actualization	178	13.1.2: Goals	202
11.6.4: Measuring Self-Determination and Control	178	13.1.3: Goal Setting	203
11.7: Problems in Behavior, and Behavior Change, from the Self-Actualization and Self-Determination Perspective	179	13.1.4: Implementation Intentions and the Importance of Strategies	203
11.7.1: Client-Centered Therapy	179	13.1.5: Deliberative and Implemental Mindsets	204
11.7.2: Beyond Therapy to Personal Growth	180	13.2: Self-Regulation and Feedback Control	204
11.8: Problems and Prospects for the Self-Actualization and Self-Determination Perspective	180	13.2.1: Feedback Control	204
Summary: Self-Actualization and Self-Determination	181	Box 13.1 Theoretical Issue: Feedback versus Reinforcement	205
12: The Cognitive Perspective	183	13.2.2: Self-Directed Attention and the Action of the Comparator	206
Box 12.1 Personal Construct Theory: Foreshadowing the Cognitive Perspective	184	13.2.3: Mental Contrasting and Goal Matching	206
12.1: Representing Your Experience of the World	184	13.2.4: Hierarchical Organization	206
12.1.1: Schemas and Their Development	184	13.2.5: Issues Concerning Hierarchical Organization	208
12.1.2: Effects of Schemas	185	13.2.6: Evidence of Hierarchical Organization	208
12.1.3: Semantic Memory, Episodic Memory, Scripts, and Procedural Knowledge	185	13.2.7: Construal Levels	209
12.1.4: Socially Relevant Schemas	186	13.2.8: Emotions	209
12.1.5: Self-Schemas	186	13.2.9: Expectancies Influence Effort versus Disengagement	209
12.1.6: Entity versus Incremental Mindsets	187	Box 13.2 Confidence about Life: Effects of Generalized Optimism	210
12.1.7: Attribution	187	13.2.10: Partial Disengagement	211
12.2: Activation of Memories	188	13.3: Further Themes in Self-Regulation	211
12.2.1: Priming and the Use of Information	189	13.3.1: Approach and Avoidance	211
12.2.2: Nonconscious Influences on Behavior	190	13.3.2: Intention-Based and Stimulus-Based Action	211
12.3: Connectionist Views of Mental Organization	190	13.3.3: Self-Regulation as Self-Control	213
Box 12.2 What's in a Name?	191	13.4: Assessment from the Self-Regulation Perspective	213
12.3.1: Dual-Process Models	192	13.4.1: Assessment of Self-Regulatory Qualities	213
Box 12.3 Delay of Gratification: The Role of Cognitive Strategies	193	Box 13.3 Reduction of Self-Regulation: Deindividuation and Alcohol	214
12.3.2: Explicit and Implicit Knowledge	194	13.4.2: Assessment of Goals	214
12.4: Broader Views on Cognition and Personality	194	13.5: Problems in Behavior, and Behavior Change, from the Self-Regulation Perspective	214
Box 12.4 The Theorist and the Theory: Mischel and His Mentors	195	13.5.1: Problems as Conflicts among Goals and Lack of Strategy Specifications	214
12.4.1: Cognitive Person Variables	195	13.5.2: Problems from an Inability to Disengage	215
12.4.2: Personality as a Cognitive–Affective Processing System	196	13.5.3: Self-Regulation and the Process of Therapy	215
12.5: Assessment from the Cognitive Perspective	197	13.5.4: Therapy Is Training in Problem Solving	216
12.5.1: Think-Aloud, Experience Sampling, and Self-Monitoring	197	13.6: Problems and Prospects for the Self-Regulation Perspective	216
12.5.2: Contextualized Assessment	197	Summary: The Self-Regulation Perspective	217
12.6: Problems in Behavior, and Behavior Change, from the Cognitive Perspective	198		
12.6.1: Information-Processing Deficits	198		

14: Overlap and Integration among Perspectives	219	14.2.1: Impulse and Restraint	225
14.1: Similarities among Perspectives	220	14.2.2: Individual versus Group Needs	226
14.1.1: Psychoanalysis and Evolutionary Psychology	220	14.3: Combining Perspectives	226
14.1.2: Psychoanalysis and Self-Regulation	221	14.3.1: Eclecticism	227
14.1.3: Psychoanalysis and Cognitive Processes	221	14.3.2: Biology and Learning as Complementary Influences on Personality	227

Preface

Perspectives on Personality, Eighth Edition, examines one of the most engaging topics in all of life: human personality. As the title of the book implies, there are many viewpoints on personality, many ways to think about human nature. This book describes a range of perspectives that are taken by personality psychologists today.

The content of this book reflects two strongly held beliefs. The first is that *ideas* are the most important part of a first course on personality. For this reason, concepts are stressed throughout the book rather than theorists. Our first priority has been to present as clearly as we can the ideas that form each theoretical viewpoint.

The second belief is that *research* is important in personality psychology. Ideas and intuitions are valuable, but someone needs to check to see whether they actually work. For this reason, each theory is accompanied by discussion of research that bears on the theory. This emphasis on the role of research stresses the fact that personality psychology is a living, dynamic process of ongoing scientific exploration.

As before, we focus on the idea that each viewpoint discussed in the book represents a *perspective* on personality. By that, we mean a particular orienting viewpoint, an angle from which the theorists proceeded. Each perspective reflects assumptions about human nature. As in previous editions, each perspective chapter includes discussion of assessment from that perspective and some discussion of how behavior problems can arise and be treated from that perspective. Each chapter concludes with a discussion of current problems and strengths within that theoretical viewpoint and our own guess about its future.

The perspectives are presented in an order that makes sense to us, but the chapters can easily be read in other orders. Each theoretical section of the book is intended to stand more or less on its own. When one chapter is linked to a previous chapter, it is generally easy to see the point without having read the prior chapter. There are a few exceptions to this, however. We refer back to the trait perspective relatively often, so it's probably best to read that chapter (Chapter 4) early on. It also makes historical sense to read the psychoanalytic perspective before the psychosocial perspective, because the latter grew partly from the former.

As in the previous editions, the final chapter takes up the question of how the different viewpoints relate to each other. The main goal of this chapter is to tie together ideas from theories discussed separately in earlier chapters. A

secondary goal is to consider the usefulness of blending theoretical viewpoints, treating theories as complementary, rather than competing.

In revising, we've tried very hard to make the content accessible. We use an informal, conversational style, and we've used examples of how the ideas can apply to one's own life. We hope these qualities make the book engaging and enjoyable, as well as informative.

New to This Edition

- Incorporates important developments in the field of personality psychology over the past 5 years or so.
- Cutting edge material has been added on topics in molecular genetics and genomics (Chapter 6) without loss of continuity with earlier versions.
- New material has been added on the biological underpinnings of impulsiveness (Chapter 7) expanding on the previous edition's coverage.
- Expanded coverage of "mindsets" as a facet of the cognitive perspective (Chapter 12).
- More detailed coverage of the role of mental contrasting in the self-regulation perspective (Chapter 13).
- Over 200 new citations have been included.

Available Instructor Resources

The following resources are available for instructors. These can be downloaded at <http://www.pearsonhighered.com/irc>. Login required.

- **Instructor's Manual:** Prepared by Steve Graham, the instructor's manual is a wonderful tool for classroom preparation and management. It includes a summary, essay questions and exercises for each chapter.
- **PowerPoint:** The PowerPoint Presentation is an exciting interactive tool for use in the classroom. Each chapter pairs key concepts with images from the textbook to reinforce student learning.
- **Test Bank:** Also prepared by Steve Graham, the Test Bank includes additional questions in multiple-choice and open-ended—short and essay response—formats.
- **MyTest:** The Eight Edition Test Bank comes with Pearson MyTest, a powerful assessment-generation program that helps instructors easily create and print quizzes and exams. Visit: <http://www.pearsonhighered.com/mytest>.

Acknowledgments

- From Coral Gables, my thanks to Youngmee Kim for putting up with me, and for so much more. Also thanks to several other people who have been part of my life during the recent past: Linda Cahan, Sheri Johnson, André Perwin, Rod Gillis, Mike Antoni, and Kiara Timpano. I am unceasingly grateful to my family: Jeff, Allysen, Alexandra, and Julia; Nancy Adams; all the Sherricks; and Mike, Karen, Meredith, and Jeremy. My thanks to Nancy Quartin, who worked very hard to help bring this revision to fruition. The revision was completed while I was a Fellow at the Center for Advanced Study in the Behavioral Sciences at Stanford University; I thank the Center for its generous support. Finally, a family sad note: Our dog

Jagun Meeso, who struggled mightily with a neurodegenerative disorder for many years, left us in July 2015. We miss her.

- From Pittsburgh, thanks go to Karen Matthews, my partner in life, and to our two children, Jeremy and Meredith. Thanks also to the following group of friends and colleagues: Chuck Carver, Sheldon Cohen, Ed Gerrard, David Klahr, Ken Kotovsky, Dick Jennings, Rich Schulz, and Jim Staszewski. Collectively, they make my life more than interesting. Finally, I'd like to thank Carnegie Mellon University for extending me a leave of absence for the past year, in part enabling me to work on the new edition of the text.

About the Authors

Charles S. Carver and **Michael F. Scheier** met in graduate school at the University of Texas at Austin, where they both earned doctoral degrees in personality psychology. After graduation, they took positions at the University of Miami and Carnegie Mellon University (CMU), respectively, where they have remained throughout their careers. They've collaborated for four decades in work that spans personality, social, motivational, clinical, and health psychology. In 1998, they received awards for Outstanding Scientific Contribution (Senior Level) from the Division of Health Psychology of the American Psychological Association (APA). In 2007, they received the Donald T. Campbell Award for Distinguished Contributions to Social Psychology from APA's Division of Personality and Social Psychology. In 2011, the first author received the Jack Block Award for Distinguished Contributions to Personality Psychology

from APA's Division of Personality and Social Psychology. In 2012, the authors received the Distinguished Lifetime Career Award from the International Society for Self and Identity. Mike was the 2003–2004 President of APA's Division of Health Psychology and served for over 10 years as Department Head at CMU. Along with eight editions of *Perspectives on Personality*, the authors have published two books on self-regulation (the more recent titled *On the Self-Regulation of Behavior*, in 1998) and more than 400 articles and chapters. Mike is an avid outdoorsman, hunter, and fisherman. Chuck keeps intending to take up painting but getting distracted by things that need fixing and shrubbery that needs cutting.

Chapter 1

What Is Personality Psychology?

Learning Objectives

- 1.1 Identify three reasons for using the concept of personality
- 1.2 Indicate the two functions that any theory should serve
- 1.3 Summarize the main themes of the 10 theoretical perspectives on personality to be discussed in this text
- 1.4 Outline reasons as to why assessment of personality, behavioral problems, and behavior change are important

Sue met Rick in a philosophy class when both were sophomores. They started spending time together, and their relationship gradually deepened. Now, two years later, they're talking seriously of marriage. Sue describes Rick like this:

"He's good looking and smart. He knows how to do things you don't expect a guy to know, like cooking. But the best part I don't even know how to describe, except to say he has a really great personality."

What qualities do you value in a potential husband or wife? Most people want to see a sense of humor, good looks, and a streak of romance. Almost always, though, a big consideration is the person's personality. Most people want someone who has a "good personality." What does that mean? If you had to describe a friend of yours who *does* have a good personality, what would you say? "Rick has a really great personality . . ." But then what?

Describing someone's personality means trying to portray the core of who that person is. It means crystallizing something from what you know about the person. It means taking a big pile of information and reducing it to a smaller essence. Personality shows up in what people say and do, and in *how* they do what they do—the style that puts a unique stamp on their actions.

1.1: Defining Personality

1.1 Identify three reasons for using the concept of personality

Trying to describe someone's personality is an exercise in being a psychologist. Everyone is a psychologist part of the time, because we all spend time trying to understand what other people are like. When you think about how to

describe someone and how those qualities are conveyed to you, you're doing informally what personality psychologists do more formally.

There's a little difference in focus, though, between what you do in daily life and what personality psychologists do. Using the word *personality* in everyday speech tends to focus on the specific personalities of specific persons (Rick, for instance). Psychologists often focus on personality as an abstraction. When psychologists use the word *personality*, they usually are referring to a conception of what everyone's personality consists of.

What *is* personality, viewed that way? Psychologists have argued for a long time about this question. Many definitions have been offered, but none is universally accepted. Personality is, in fact, an elusive concept.

1.1.1: Why Use the Word *Personality* as a Concept?

In trying to define personality as a concept, we might start by thinking about why people use the word. Understanding why it's used should help us decide what it means. When *you* use the word *personality*, why do you use it?

One reason people use the word *personality* is to convey a sense of *consistency* or *continuity* about a person. There are

several kinds of consistency, all of which evoke the concept of personality. There is consistency across time (Sue talked a lot when you first met her, and years later she still dominates conversations). There is consistency across similar situations (André is very polite to waiters and has been that way every time you've been with him in a restaurant). Sometimes you even see consistency across situations that are quite different from each other (Victoria tends to order people around—at work, in stores, even at parties). In each case, it's undeniably the same person from one instance to another, because the person acts (or talks, or thinks, or feels) in consistent ways from time to time and from setting to setting. One reason for using the word *personality* is to capture this consistency or continuity within the person.

A second reason people use the word *personality* is to convey the sense that whatever the person is doing (or thinking or feeling) *originates from within*. The idea that behavior comes from inside the person may seem so obvious that it hardly deserves noting, but not everyone sees it that way. Nonetheless, the term *personality* conveys the sense of a causal force *within* the person, influencing how the person acts. That internal force in fact has very important behavioral effects (Ozer & Benet-Martínez, 2006; Roberts, Kuncel, Shiner, Caspi, & Goldberg, 2007).

These two reasons for using the term *personality* combine when you try to predict and understand people's behavior (even your own). It's important to predict behavior. When you choose a roommate for next year, you're predicting that you'll get along. When you tell a friend who you know is always late that the movie starts at 8:00, when it really starts at 8:30, you're predicting that doing this will get her to arrive more or less on time. An important contributor to these predictions is your view of the other person's personality.

The term *personality* is also used for another reason. It often conveys the sense that a few qualities can summarize what a person is like, because they're so prominent in that person's behavior. Saying that Karen has a sociable personality implies that sociability stands out in her actions. Saying

Individual differences in behavior and reactions are an important part of personality.

that Tanya has a hostile personality implies that hostility is a key quality in her. Noting the most prominent characteristics of a person brings to mind the concept of personality, because those characteristics seem to capture what the person is like.

This patchwork of reasons for using the term *personality* moves us closer to having a definition for it. That is, the word *personality* conveys a sense of consistency, internal causality, and distinctiveness. As it happens, these elements are included in almost all definitions of personality.

1.1.2: A Working Definition

Here's one definition. We're not saying it's "right," but we think it comes close. We've adapted it slightly from one written decades ago by Gordon Allport (1961): *Personality is a dynamic organization, inside the person, of psychophysical systems that create the person's characteristic patterns of behavior, thoughts, and feelings.*

This definition makes several points:

- Personality isn't just an accumulation of bits and pieces; it has *organization*.
- Personality doesn't just lie there; it has *processes* of some sort.
- Personality is a *psychological* concept, but it's tied to the *physical* body.
- Personality is a *causal force* that helps determine how the person relates to the world.
- Personality shows up in individualized *patterns*—recurrences and consistencies.
- Personality is displayed not just one way but *many ways*—in behaviors, thoughts, and feelings.

This definition covers a lot. It points to several elements that should be part of any view of personality. As good as it is, though, it isn't perfect. Even this careful definition seems to let something about the concept slip through your fingers. This elusiveness is something that personality psychologists have struggled with for as long as the term has been used.

1.1.3: Two Fundamental Themes in Personality Psychology

Two themes stand out in thinking about personality. One is **individual differences**. Each person who ever lived is different from everyone else. No two personalities are quite alike—not even those of identical twins. Some people are generally happy, some are sad. Some people are sociable, some are shy. As we said earlier, one reason to use the word *personality* in the first place is to capture central features of a person. This couldn't happen if the features didn't differ from one person to another. Thus, the notion of individual differences is important even in everyday use of the term *personality*.

Individual differences are also important to theorists who try to understand personality. To be useful, any

approach to personality has to have something to say about these differences. A really complete account of personality should address where the differences come from. A complete account should also consider why the differences matter.

The other theme concerns what we'll call **intrapersonal functioning**. By this phrase, we mean the processes within the person that Allport (1961) called a "dynamic organization" of systems. The idea here is that personality isn't like a rubber stamp that you pound onto each situation you enter. Instead, it involves processes that go on inside you, leading you to act the way you do. The processes create a sense of continuity within the person, even if the person acts differently in different circumstances. That is, the same processes are engaged, even if the results differ across situations.

Here's an example. Some people believe that behavior is a product of motives. Motive tendencies rise and fall as time passes and situations change. Which motive is strongest at any given time determines what the person does at that time. A person may work alone for four hours, then spend a couple of hours hanging out with friends, then go eat dinner, followed by some TV. The behaviors differ, but they all stem from motives that vary in strength over the course of the day. This view of personality treats the motives as key variables. In this view, the processes by which motives vary in strength are some of the processes of intrapersonal functioning.

This is just one example of an intrapersonal process. It's not the only process that has been argued for. Regardless of what processes are assumed, though, the idea of *process* is important. A complete account of personality should say something about processes underlying personality and how and why they work.

Different approaches to personality emphasize these two themes to differing degrees. Some approaches emphasize process and consist largely of a view of intrapersonal functioning. Other approaches treat individual uniqueness as most important and are more vague about the processes underlying the uniqueness. These differing emphases contribute to the diversity among personality theories.

Why spend so many words on what personality psychology is about? We've placed you in the role of a theorist here. Theorists have to keep in mind what aspects of human experience they want to understand. To understand the theories, you'll have to do that too.

1.2: Theory in Personality Psychology

1.2 Indicate the two functions that any theory should serve

Much of this book is descriptions of theoretical principles. Because theories will be so important, let's spend a little time on what they are, what they do, and how to evaluate them.

1.2.1: What Do Theories Do?

What *is* a theory? A **theory** is a summary statement, a general principle or set of principles about a class of events. It's a set of ideas about how to think about that class of events. A theory can apply to a very specific class of events, or it can be broader. Some theories in psychology are about processes in a single nerve cell. Others concern complex behaviors, such as maintaining close relationships, playing chess, and living a full life.

No matter what they are about, theories have two purposes. The first is to *explain* the phenomena it addresses. A theory always gives a way to explain some things that are known to be true. For example, biological personality theories hold that heredity influences personality. This idea provides a way to explain why children seem like their parents in certain ways (which we know to be true).

Every theory about personality provides an account of at least some phenomena. This first purpose of the theory—*explanation*—is fundamental. Without giving an explanation for at least some of what's already known, a theory would be useless.

Theories also have a second purpose, though. A theory should suggest possibilities you don't yet know for sure are true. Put differently, a theory should allow you to *predict new information*. A theory should let you predict things you haven't thought to look for yet—maybe things *nobody* has thought to look for yet. For the personality psychologist, this is where much of the excitement lies.

Psychologists generally want to make predictions about large numbers of people, but the same principle holds when you make predictions in your own life. It's exciting to take an idea about personality and use it to predict how your roommate will react to a situation you haven't seen her in before. It's particularly exciting when your prediction turns out to be right!

The predictive aspect of theories is more subtle and more difficult than the explanatory aspect. The difficulty comes partly from the fact that most theories have a little ambiguity. This often makes it unclear exactly what the prediction should be. In fact, the broader the theory (the more things it tries to account for), the more likely it is to be ambiguous. As you've seen, personality is a very broad concept. This makes theories of personality broad and complex. As a result, it's sometimes hard to use them to make very specific predictions.

1.2.2: The Role of Research in Evaluating Theories

How do psychologists decide whether a theory is any good? In describing the predictive role of theories, we've revealed a bias most personality psychologists hold: Theories should be *testable*, and they should be *tested*. It's

important to find out whether a theory makes predictions that work.

We want to be quite clear about what we're saying here. Personality is so important that lots of people besides psychologists try to understand it. Theologians, philosophers, artists, poets, novelists, and songwriters have all written about personality, and many have had good insights about it. We don't mean to diminish the value of these insights. But are the insights enough?

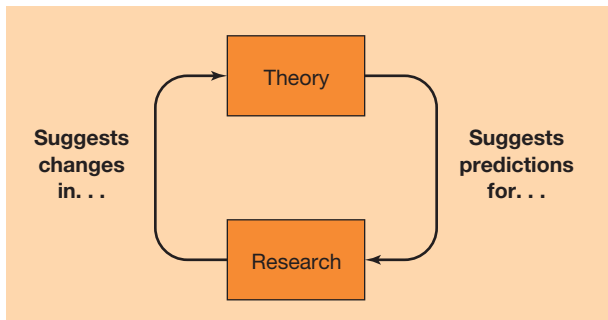

People have different opinions on this. Some believe that insight stands on its own. Even some personality theorists believed this. Sigmund Freud, who's often viewed as the father of personality psychology, wasn't much interested in whether his ideas were supported in others' research. He thought the insights were sufficient in themselves.

The view that dominates today's psychology, however, is that ideas—even brilliant ones—have to be tested before they can be trusted. Too often, things that *seem* true turn out not to be true. Unfortunately, until you test them, you never know which ideas are brilliant and right and which are brilliant but wrong. Because of this, today's personality psychology is a scientific field, in which research counts for a lot. Studies of personality provide information about how accurate or useful a theory is. The studies either confirm or disconfirm predictions and thereby support or undermine the theory.

When theories are used to generate predictions for research, a continuous interplay arises (see Figure 1.1). If a theory makes predictions, the result is research—scientific studies—to test the predictions. Results often support the predictions. Sometimes, however, the result either fails to support the theory or supports it only partly. This may suggest a limit on the theory—perhaps it predicts under some conditions but not others. Such a finding leads to revision of the theory.

Figure 1.1

In a scientific approach to personality psychology, there is a continuous cycling between theory and research. Theory suggests predictions to be tested, and the results of studies suggest the need for new or modified theory.

Once it's been revised, the theory must be tested again, because it's no longer quite the same theory. Its new ele-

ments must be examined for other predictions they might make. The cycle of prediction, testing, revision or refinement, and additional prediction and testing can be virtually never ending.

1.2.3: What Else Makes a Theory Good?

An important basis for deciding whether a theory is good is whether it does what it's supposed to do: explain and predict. But that's not the only way people evaluate theories. There are several more criteria.

One of them is the breadth of the information behind the theory. Some theories are criticized because they're based heavily on the theorists' experiences conducting therapy. Other theories are criticized because they're based on studies of laboratory animals in highly artificial situations. Others are criticized because they rest largely on information from long sets of rating scales. None of these sources of information is bad in itself. But to base a theory on just one source of information weakens the theory.

Like a good work of art, a good theory should evoke some sort of reaction, either good or bad, but not indifferent.

A theory should also have the quality of **parsimony**. That is, it should include as few assumptions (or concepts) as possible. Put differently, it should be as simple as possible. This criterion is important, but there's a danger in applying it too rigidly. Knowledge is far from complete. A theory that looks parsimonious today may not be able to account for something that will be discovered tomorrow. A theory that looks too complex today may be the *only* one that can handle tomorrow's discovery. Nevertheless, excess theoretical "baggage" is a cause for concern.

Another part of evaluating theories is highly subjective. Some theories just "feel" better than others. Some theories will fit your personal worldview better than others. You're not the only one who reacts this way. So do

psychologists. There's even evidence that scientists prefer theories that fit their images of *themselves* (Johnson, Germer, Efran, & Overton, 1988). William James, an important figure in the early years of psychology, said people will prefer theories that "are most interesting, . . . appeal most urgently to our æsthetic, emotional, and active needs" (James, 1890, p. 312). Which theories feel best to you, then, depends partly on how you see the world.

1.3: Perspectives on Personality

1.3 Summarize the main themes of the 10 theoretical perspectives on personality to be discussed in this text

Now, let's preview the views of personality you will be reading about. The chapters all describe viewpoints that are influential today and will likely continue to be influential for some time to come. The theories range considerably in their starting points, which can make matters a little confusing. The starting point, in some sense, is always a view of human nature—of what aspect of human experience is the key to understanding people.

In explaining why someone did something, people often say "It's just human nature." But what *is* human nature? *In what terms* should we think about the nature of people? Different theorists have offered very different answers.

1.3.1: Perspectives to Be Examined Here

Each theoretical orientation discussed in this book has a somewhat different angle on human nature. Thus, each represents a different *perspective* on what constitute the central elements of the human experience. Here are brief overviews of the perspectives you'll be reading about.

The *trait perspective* begins with the intuitive idea that people have fairly stable qualities (traits) that are displayed across many settings and are deeply embedded in the person. This way of thinking originated in ancient times, but it remains very important today. From this point of view, the big issues are what (and how many) traits are the important ones in personality and how trait differences are expressed in behavior.

The *motive perspective* begins with the idea that the key element in human experience is the motive forces that underlie behavior. Theorists have posited many different motives and have studied how several of them vary over time and under different circumstances. People also differ in their patterns of underlying strengths of different motives. These differences in the balance of motives are seen as the core of personality, from this perspective.

The *inheritance and evolution perspective* emphasizes the fact that humans are creatures that evolved across millennia and that human nature (whatever it is) is deeply rooted in our genes. In this view, personality is genetically based. Dispositions are inherited. Indeed, some theorists take this idea a step further to suggest that many qualities of human behavior (and thus personality) exist precisely because long ago they had evolutionary benefits.

Another biological view, the *biological process perspective*, stems from the idea that personality reflects the workings of the body we inhabit and the brain that runs the body. This biological perspective focuses on how the nervous system and hormones influence people's behavior and how differences in those functions influence the kind of person you are.

The *psychoanalytic perspective*, taken up next, is a very different view of human nature. It's based on the idea that personality is a set of internal psychic forces that compete and conflict with one another. The focus of this perspective is on the dynamics of these forces (and how they influence behavior). Human nature, from this viewpoint, involves a set of pressures inside the person that sometimes work with each other and sometimes are at war with each other. One specific theory dominates the perspective—the theory of Sigmund Freud.

We've termed the next perspective *psychosocial*. The theories in this perspective start from the assumption that the most important aspect of human nature is our formation of relationships with other people and the ways these relationships play out. The psychosocial theories evolved from psychoanalytic theory (for that reason they sometimes are called *neoanalytic*), but they really represent a very different worldview.

The *learning perspective* begins with a view of human nature in which change, rather than constancy, is paramount. From this perspective, the key quality of human nature is that behavior changes systematically as a result of experiences. Because there are several views of how learning takes place, several theories link learning to personality. In this perspective, a person's personality is the integrated sum of what the person has learned up till now.

The *self-actualization and self-determination perspective*, also sometimes referred to as an *organismic perspective*, has its roots in the idea that every person has the potential to grow and develop into a valuable human being if permitted to do so. In this view, people naturally tend toward self-perfection. People can move themselves more fully in that direction by exercising their free will and by having environments that support that effort. The sense of self-determination is central to this view of human nature. In this view, personality is partly the uniqueness hidden within and partly what the person chooses to make of that uniqueness.

The *cognitive perspective* takes as its starting point the idea that human nature involves deriving meaning from

experiences. The mind imposes organization and form on experience, and those mental organizations influence how people act. From this viewpoint, understanding personality means understanding the processes of constructing the world and how they determine one's actions in and reactions to the world.

The *self-regulation perspective* starts from the idea that people are complex psychological systems, in the same sense that homeostatic processes reflect complex physiological systems and weather reflects complex atmospheric systems. There are recurrent processes that organize actions to attain specific endpoints. Self-regulating psychologically means (in part) synthesizing goals and moving toward those goals.

1.3.2: Perspectives Reconsidered

As we said, each perspective takes a different starting point to think about personality. We'll also say this about them: Most of them weren't really intended to be full models of personality, and it can be a little misleading to present them (and judge them) as though they were.

There was a time when personality psychologists created grand theories aimed at the total complexity of personality (Freud's theory is the best example). However, this is less common now. More common are theories that deal with some *aspect* of personality or some set of issues or processes in personality. The fact that a theory isn't grand in scale doesn't mean it has nothing important to say. It does mean, though, that it won't say *everything*. It gives us a particular viewing angle on personality. This viewing angle may be special and may yield insights you can't find from other angles. But it yields only part of the picture. This limitation is important to keep in mind as you think about the various theories and what each has to say.

Will personality return in the future to grand-scale theories? Several contemporary personality psychologists hope so (e.g., McAdams & Olson, 2010; McAdams & Pals, 2006; Roberts & Wood, 2006). They argue that a full understanding of personality requires much more than is generally addressed by "perspective" theories. This movement is partly a reaction to the concern that personality psychology has lost its focus on individuality.

What should be included in the full picture, though, is a matter of opinion (Table 1.1). Most who write on this topic say the genetic design of the human should be included, along with traits. Some think motives, values, abilities, and skills should be included as part of personality. Most who write on this topic now include integrative narratives—stories that people develop about themselves to provide coherence and meaning to their self-understanding. In some accounts, culture is part of the personality picture; in others, it is seen as a force outside personality that can affect personality.

Table 1.1 Topics that some now argue should be included for a full understanding of personality

Topic	Level of Agreement
Genetic design of the human	High
Dispositional traits	High
Motives and values	Moderate
Abilities (skills)	Moderate
Adaptations (e.g., beliefs)	Moderate
Integrative narratives	High
Culture	Low

SOURCE: Based on discussions by McAdams and Pals (2006), McCrae (2010), and Roberts and Wood (2006).

It is very hard to present a picture of personality that incorporates all of those topics at once. In some ways, the emerging broader accounts actually aren't really grand-scale theories, but a putting-together of several perspective views. We'll touch on most of the ideas that go into these broader accounts at one point or another, but we will do it one perspective at a time.

1.4: Organization within Chapters

1.4 Outline reasons as to why assessment of personality, behavioral problems, and behavior change are important

Let's now say a little bit about how chapters are organized. Most of the content of each chapter is a description of the elements and processes of personality, as viewed from that perspective. Each chapter thus tells you about individual differences and intrapersonal functioning, as seen by that theoretical viewpoint.

Each chapter also addresses two more subjects. One is what that perspective says about the process of measuring personality, called *assessment*. The other addresses potential problems that people may experience, and the processes by which behavior is changed for the better through therapy. Here's a brief preview of what these sections will be like.

1.4.1: Assessment

Personality psychologists give considerable attention to the process of measuring personality, for at least three reasons. First, they want to be able to portray the personalities of specific persons, just as you characterize the personalities of people you know. To be confident these pictures are accurate, psychologists need good ways to measure personality.

A second reason concerns research. To study qualities that pertain to personality, psychologists have to measure those qualities. Without being able to assess individual differences or intrapersonal functioning, it's impossible to study them. Good assessment, then, lies at the heart of personality research.

A third reason to measure personality strays a bit from the main focus of this book. Assessing people's personality is an important part of applied psychology. For example, organizational psychologists use personality to help make hiring decisions (e.g., you might want to hire someone with a desired pattern of motives). Clinical psychologists use personality assessment to help diagnose problems.

Assessment is important throughout personality psychology. Some issues in assessment are the same for all perspectives (these are addressed in Chapter 3). But assessment is also viewed somewhat differently from different perspectives, because different perspectives highlight different aspects of behavior and experience. As a result, perspectives often differ in the techniques they emphasize. In discussing assessment in each later chapter, we focus on how assessment from that viewpoint has its own special character.

1.4.2: Problems in Behavior, and Behavior Change

The other topic included in each theory chapter concerns the fact that people's lives don't always go smoothly. Each view of normal personality also suggests a way to think about problems. Indeed, it can be argued that a theory of personality gains credibility from saying useful things about problems. To clarify how each approach to personality views problems, we briefly take up this issue in each

chapter from that chapter's viewpoint. As with assessment, our emphasis is on that theoretical orientation's special contribution to thinking about problems.

Personality does not always function smoothly. Each perspective on personality has its own view about why problems occur.

Finally, we describe how the theoretical orientation under discussion contributes to understanding therapy to deal with problems. If each view has a way of thinking about normal processes and about how things can go wrong, each view also has a way to think about how to make things better. Each suggests ways to turn problematic functioning back into effective and satisfying functioning.

Summary: What Is Personality Psychology?

Personality is a hard concept to define. Thinking about how people use the concept, however, suggests three reasons for its use. People use it to convey a sense of consistency or continuity within a person, to convey the sense that the person is the origin of behavior, and to convey the sense that the essence of a person can be summarized or captured in a few salient qualities.

The field of personality addresses two fundamental themes. One is the existence of differences among people.

The other is how best to conceptualize intrapersonal functioning—the processes that take place within all persons, giving form and continuity to behavior.

Much of this book deals with theories. Theories are summary statements, sets of principles that pertain to certain classes of events. Theories have two purposes: to explain things that are known and to predict possibilities that haven't yet been examined. One way to evaluate the worth of a theory is to ask whether research supports its

predictions. Scientific psychology has a continuing cycle between theory and research, as theories are tested, modified on the basis of results, and tested again.

Theories can be evaluated on grounds other than research, though. For example, a theory shouldn't be based on a single kind of information. Theories benefit from being parsimonious—having relatively few assumptions (or concepts). People also tend to favor theories that fit well with their intuitions and personal world view.

The theories described in this book derive from several perspectives, or viewpoints, on human nature. Each theory chapter focuses on assumptions about the nature of personality within a particular theoretical framework. Also included are a discussion of assessment from the viewpoint of the theory under discussion, and a discussion of problems in behavior and how they can be remedied.

Chapter 2

Methods in the Study of Personality

Learning Objectives

2.1 Define case study, experience sampling, and the concept of generality

2.2 Examine the process of establishing two kinds of relationships between variables

Sam and Dave are taking a break from studying. Sam says, “My roommate’s girl at home broke up with him. Chicks here better watch out, ‘cause he’s gonna be doin’ some serious partying to forget her.”

“What makes you think so?”

“What kind of dumb question is that? It’s obvious. That’s what I’d do.”

“Huh. I know guys whose hometown girls dumped them, and none of them did that. It was exactly the opposite. They laid around moping. I don’t think you know anything about how people react to breakups.”

When people try to understand personality, where do they start? How do they form theories? How do they test them? How do psychologists decide what to believe? These are all questions about the methods of science. They exist in all kinds of science, from astronomy to zoology. They’re particularly challenging, though, when applied to personality.

2.1: Gathering Information

2.1 Define case study, experience sampling, and the concept of generality

There are two main sources of information about personality. One of them is your own personal experience of the world. The other is other people and how they react to the world. Each is useful but neither is perfect.

2.1.1: Observe Yourself and Observe Others

One way to get information about personality is to look to your own experience—a process called *introspection*. This technique (what Sam in the opening example did) is open to everyone. Try it. You have a personality. If you want to understand personality, take a look at yours. Sit back and think about your life. Think about what you did in various situations and how you felt. Pull from those recollections a

thread of continuity. From this you might even start to form a theory—a set of ideas to explain your thoughts, feelings, and actions.

Looking at your own experience is an easy beginning, but it has a problem. Specifically, your consciousness has a special relationship to your memories because they’re yours. It’s hard to be sure this special relationship doesn’t distort what you’re seeing. For instance, you can misremember something you experienced, yet feel sure your memory is correct.

This problem goes away when you look at someone else instead of yourself (like Dave in the opening example). That’s the second method of gathering information: Observe someone else. This method also has a problem, though—the opposite of introspection’s problem. Specifically, it’s impossible to be “inside another person’s head,” to really know what that person is thinking and feeling. This difference in perspective can create vast differences in understanding. It can also lead to misinterpretation. Which is better? Each has a place in the search for truth. Neither is perfect, but they sometimes can be used to complement one another.

2.1.2: Depth Through Case Studies

These two starting points lead in several directions. Personality psychologists sometimes try to understand an entire person at once, rather than just part of the person.
