ABOUT THE AUTHORS

JEFF HARDIN received his Ph.D. in Biophysics from the University of California–Berkeley. He is Professor and Chair of the Zoology Department at the University of Wisconsin–Madison, where he has been since 1991. He is also Faculty Director of the Biology Core Curriculum, a four-semester honors biology sequence for undergraduates at Wisconsin known for its teaching innovations. Jeff’s research focuses on how cells migrate and adhere to one another during early embryonic development. Jeff’s teaching is enhanced by his extensive use of digital microscopy and his web-based teaching materials, which are used on many campuses in the United States and in other countries. Jeff was a founding member of the UW Teaching Academy, and has received several teaching awards, including a Lily Teaching Fellowship, a National Science Foundation Young Investigator Award, and a Chancellor’s Distinguished Teaching Award.

GREGORY BERTONI has been active in teaching, research, and scientific writing for more than 30 years. He earned a Ph.D. in Cell and Molecular Biology from the University of Wisconsin–Madison with Wayne Becker, where his research investigated the effects of light quality and carbon dioxide concentration on photorespiratory gene expression. While in Madison, he and Wayne helped to develop a new course entitled “Ways of Knowing” designed to introduce entering freshmen to the learning process. His published research includes studies in bacterial pathogenesis, plant–microbe interactions, and plant gene expression. Currently, Gregory is a Science Editor for *The Plant Cell*, a leading international research journal in plant cell and molecular biology. For the past 12 years, Gregory has been teaching biology, chemistry, and microbiology part-time at the community college level, and currently teaches at Southern Maine Community College in South Portland, Maine. He is also a freelance scientific writer who contributes to text- and web-based projects in biology, physics, and microbiology. His hobbies include hiking, gardening, and growing certified organic seedlings for A Good Start, a small business he and his wife Marianne Potter founded in 2003.

WAYNE M. BECKER taught cell biology at the University of Wisconsin–Madison for 30 years until his retirement. His interest in textbook writing grew out of notes, outlines, and problem sets that he assembled for his students, culminating in *Energy and the Living Cell*, a paperback text on bioenergetics published in 1977, and *The World of the Cell*, the first edition of which appeared in 1986. All his degrees are in biochemistry from the University of Wisconsin–Madison, an orientation that is readily discernible in his writing. His research interests were in plant molecular biology, focused on the expression of genes that encode enzymes of the photorespiratory pathway. Later in his career he focused on teaching, especially students from underrepresented groups. His honors include a Chancellor’s Award for Distinguished Teaching, Guggenheim and Fulbright Fellowships, and a Visiting Scholar Award from the Royal Society of London. This text builds on his foundation, and is inspired by his legacy.

DETAILED CONTENTS

ABOUT THE AUTHORS 3

PREFACE 18

ACKNOWLEDGMENTS 24

1 A Preview of Cell Biology 25

1.1 The Cell Theory: A Brief History 26

Advances in Microscopy Allowed Detailed Studies of Cells 26

The Cell Theory Applies to All Organisms 26

1.2 The Emergence of Modern Cell Biology 27

The Cytological Strand Deals with Cellular Structure 29

The Biochemical Strand Studies the Chemistry of Biological Structure and Function 33

The Genetic Strand Focuses on Information Flow 35

1.3 How Do We Know What We Know? 38

Biological “Facts” May Turn Out to Be Incorrect 38

Experiments Test Specific Hypotheses 38

Model Organisms Play a Key Role in Modern Cell Biology Research 39

Well-Designed Experiments Alter Only One Variable at a Time 41

Summary of Key Points 42

Problem Set 43

KEY TECHNIQUE Using Immunofluorescence to Identify Specific Cell Components 32

HUMAN CONNECTIONS The Immortal Cells of Henrietta Lacks 40

2 The Chemistry of the Cell 45

2.1 The Importance of Carbon 46

Carbon-Containing Molecules Are Stable 47

Carbon-Containing Molecules Are Diverse 48

Carbon-Containing Molecules Can Form Stereoisomers 49

2.2 The Importance of Water 50

Water Molecules Are Polar 51

Water Molecules Are Cohesive 52

Water Has a High Temperature-Stabilizing Capacity 52

Water Is an Excellent Solvent 52

2.3 The Importance of Selectively Permeable Membranes 55

A Membrane Is a Lipid Bilayer with Proteins Embedded in It 55

Lipid Bilayers Are Selectively Permeable 56

2.4 The Importance of Synthesis by Polymerization 56

Macromolecules Are Critical for Cellular Form and Function 56

Cells Contain Three Different Kinds of Macromolecular Polymers 58

Macromolecules Are Synthesized by Stepwise Polymerization of Monomers 59

2.5 The Importance of Self-Assembly 60

Noncovalent Bonds and Interactions Are Important in the Folding of Macromolecules 61

Many Proteins Spontaneously Fold into Their Biologically Functional State 61

Molecular Chaperones Assist the Assembly of Some Proteins 62

Self-Assembly Also Occurs in Other Cellular Structures 62

The Tobacco Mosaic Virus Is a Case Study in Self-Assembly 62

Self-Assembly Has Limits 63

Hierarchical Assembly Provides Advantages for the Cell 63

Summary of Key Points 64

Problem Set 65

KEY TECHNIQUE Determining the Chemical Fingerprint of a Cell Using Mass Spectrometry 50

HUMAN CONNECTIONS Taking a Deeper Look: Magnetic Resonance Imaging (MRI) 54

3 The Macromolecules of the Cell 66

3.1 Proteins 67

The Monomers Are Amino Acids 67

The Polymers Are Polypeptides and Proteins 69

Several Kinds of Bonds and Interactions Are Important in Protein Folding and Stability 70

Protein Structure Depends on Amino Acid Sequence and Interactions 73

3.2 Nucleic Acids 82

The Monomers Are Nucleotides 82

The Polymers Are DNA and RNA 83

A DNA Molecule Is a Double-Stranded Helix 85

3.3 Polysaccharides 86

The Monomers Are Monosaccharides 86

The Polymers Are Storage and Structural Polysaccharides 88

Polysaccharide Structure Depends on the Kinds of Glycosidic Bonds Involved 90

3.4 Lipids 90

Fatty Acids Are the Building Blocks of Several Classes of Lipids 91

Triacylglycerols Are Storage Lipids 93

Phospholipids Are Important in Membrane Structure 93

Glycolipids Are Specialized Membrane Components 94

Steroids Are Lipids with a Variety of Functions 94

Terpenes Are Formed from Isoprene 95

Summary of Key Points 95

Problem Set 96

HUMAN CONNECTIONS Aggregated Proteins and Alzheimer's 71

KEY TECHNIQUE Using X-Ray Crystallography to Determine Protein Structure 80

4 Cells and Organelles 99

4.1 Where Did the First Cells Come From? 99

Simple Organic Molecules May Have Formed Abiotically in the Young Earth 99

RNA May Have Been the First Informational Molecule 100

Liposomes May Have Defined the First Primitive Protocells 101

4.2 Properties and Strategies of Cells 101

All Organisms Are Bacteria, Archaea, or Eukaryotes 101

There Are Several Limitations on Cell Size 102

Bacteria, Archaea, and Eukaryotes Differ from Each Other in Many Ways 104

4.3 The Eukaryotic Cell in Overview: Structure and Function 107

The Plasma Membrane Defines Cell Boundaries and Retains Contents 107

The Nucleus Is the Information Center of the Eukaryotic Cell 108

Mitochondria and Chloroplasts Provide Energy for the Cell 109

The Endosymbiont Theory Proposes That Mitochondria and Chloroplasts Were Derived From Bacteria 111

The Endomembrane System Synthesizes Proteins for a Variety of Cellular Destinations 113

Other Organelles Also Have Specific Functions 116

Ribosomes Synthesize Proteins in the Cytoplasm 119

The Cytoskeleton Provides Structure to the Cytoplasm 119

The Extracellular Matrix and Cell Walls Are Outside the Plasma Membrane 122

4.4 Viruses, Viroids, and Prions: Agents That Invade Cells 123

A Virus Consists of a DNA or RNA Core Surrounded by a Protein Coat 123

Viroids Are Small, Circular RNA Molecules That Can Cause Plant Diseases 124

Prions Are Infectious Protein Molecules 125

Summary of Key Points 125

Problem Set 126

HUMAN CONNECTIONS When Cellular “Breakdown” Breaks Down 116

KEY TECHNIQUE Using Centrifugation to Isolate Organelles 120

5 Bioenergetics: The Flow of Energy in the Cell 128

5.1 The Importance of Energy 129

Cells Need Energy to Perform Six Different Kinds of Work 129

Organisms Obtain Energy Either from Sunlight or from the Oxidation of Chemical Compounds 130

Energy Flows Through the Biosphere Continuously 131

The Flow of Energy Through the Biosphere Is Accompanied by a Flow of Matter 133

5.2 Bioenergetics 133

Understanding Energy Flow Requires Knowledge of Systems, Heat, and Work 133

The First Law of Thermodynamics States That Energy Is Conserved 134

The Second Law of Thermodynamics States That Reactions Have Directionality 136

Entropy and Free Energy Are Two Means of Assessing Thermodynamic Spontaneity 137

5.3 Understanding ΔG and K_{eq} 140

The Equilibrium Constant K_{eq} Is a Measure of Directionality 140

ΔG Can Be Calculated Readily 141

The Standard Free Energy Change Is ΔG Measured Under Standard Conditions 141

Summing Up: The Meaning of $\Delta G'$ and $\Delta G^{\circ'}$ 144

Free Energy Change: Sample Calculations 145

Jumping Beans Provide a Useful Analogy for Bioenergetics 146

Life Requires Steady-State Reactions That Move Toward Equilibrium Without Ever Getting There 147

Summary of Key Points 148

Problem Set 149

HUMAN CONNECTIONS The “Potential” of Food to Provide Energy 135

KEY TECHNIQUE Measuring How Molecules Bind to One Another Using Isothermal Titration Calorimetry 142

6 Enzymes: The Catalysts of Life 151

6.1 Activation Energy and the Metastable State 152

Before a Chemical Reaction Can Occur, the Activation Energy Barrier Must Be Overcome 152

The Metastable State Is a Result of the Activation Barrier 153

Catalysts Overcome the Activation Energy Barrier 153

6.2 Enzymes as Biological Catalysts 154

Most Enzymes Are Proteins 154

Substrate Binding, Activation, and Catalysis Occur at the Active Site 157

Ribozymes Are Catalytic RNA Molecules 159

6.3 Enzyme Kinetics 161

Monkeys and Peanuts Provide a Useful Analogy for Understanding Enzyme Kinetics 161

Most Enzymes Display Michaelis–Menten Kinetics 162

What Is the Meaning of V_{max} and K_m ? 163

Why Are K_m and V_{max} Important to Cell Biologists? 164

The Double-Reciprocal Plot Is a Useful Means of Visualizing Kinetic Data 164

Enzyme Inhibitors Act Either Irreversibly or Reversibly 165

6.4 Enzyme Regulation 168

Allosteric Enzymes Are Regulated by Molecules Other than Reactants and Products 168

Allosteric Enzymes Exhibit Cooperative Interactions Between Subunits 170

Enzymes Can Also Be Regulated by the Addition or Removal of Chemical Groups 170

Summary of Key Points 172

Problem Set 173

HUMAN CONNECTIONS ACE Inhibitors: Enzyme Activity as the Difference Between Life and Death 160

KEY TECHNIQUE Determining K_m and V_{max} Using Enzyme Assays 166

7 Membranes: Their Structure, Function, and Chemistry 176

7.1 The Functions of Membranes 177

- Membranes Define Boundaries and Serve as Permeability Barriers 177
- Membranes Are Sites of Specific Proteins and Therefore of Specific Functions 177
- Membrane Proteins Regulate the Transport of Solutes 178
- Membrane Proteins Detect and Transmit Electrical and Chemical Signals 178
- Membrane Proteins Mediate Cell Adhesion and Cell-to-Cell Communication 178

7.2 Models of Membrane Structure: An Experimental Perspective 179

- Overton and Langmuir: Lipids Are Important Components of Membranes 179
- Gorter and Grendel: The Basis of Membrane Structure Is a Lipid Bilayer 179
- Davson and Danielli: Membranes Also Contain Proteins 180
- Robertson: All Membranes Share a Common Underlying Structure 180
- Further Research Revealed Major Shortcomings of the Davson–Danielli Model 180
- Singer and Nicolson: A Membrane Consists of a Mosaic of Proteins in a Fluid Lipid Bilayer 181
- Unwin and Henderson: Most Membrane Proteins Contain Transmembrane Segments 181
- Recent Findings Suggest Membranes Are Organized into Microdomains 182

7.3 Membrane Lipids: The “Fluid” Part of the Model 183

- Membranes Contain Several Major Classes of Lipids 183
- Fatty Acids Are Essential to Membrane Structure and Function 185
- Thin-Layer Chromatography Is an Important Technique for Lipid Analysis 185
- Membrane Asymmetry: Most Lipids Are Distributed Unequally Between the Two Monolayers 186
- The Lipid Bilayer Is Fluid 187
- Membranes Function Properly Only in the Fluid State 187
- Most Organisms Can Regulate Membrane Fluidity 190
- Lipid Rafts Are Localized Regions of Membrane Lipids That Are Involved in Cell Signaling 191

7.4 Membrane Proteins: The “Mosaic” Part of the Model 192

- The Membrane Consists of a Mosaic of Proteins: Evidence from Freeze-Fracture Microscopy 192
- Membranes Contain Integral, Peripheral, and Lipid-Anchored Proteins 192
- Membrane Proteins Can Be Isolated and Analyzed 195
- Determining the Three-Dimensional Structure of Membrane Proteins Is Becoming Easier 198
- Molecular Biology Has Contributed Greatly to Our Understanding of Membrane Proteins 199
- Membrane Proteins Have a Variety of Functions 199
- Membrane Proteins Are Oriented Asymmetrically Across the Lipid Bilayer 200
- Many Membrane Proteins and Lipids Are Glycosylated 200
- Membrane Proteins Vary in Their Mobility 202
- The Erythrocyte Membrane Contains an Interconnected Network of Membrane-Associated Proteins 204
- Summary of Key Points 205
- Problem Set 206

KEY TECHNIQUE SDS–Polyacrylamide Gel Electrophoresis (SDS-PAGE) of Membrane Proteins 196

8 Transport Across Membranes: Overcoming the Permeability Barrier 209

8.1 Cells and Transport Processes 210

- Solutes Cross Membranes by Simple Diffusion, Facilitated Diffusion, and Active Transport 210
- The Movement of a Solute Across a Membrane Is Determined by Its Concentration Gradient or Its Electrochemical Potential 210
- The Erythrocyte Plasma Membrane Provides Examples of Transport Mechanisms 212

8.2 Simple Diffusion: Unassisted Movement Down the Gradient 212

- Diffusion Always Moves Solutes Toward Equilibrium 213
- Osmosis Is the Diffusion of Water Across a Selectively Permeable Membrane 213
- Simple Diffusion Is Typically Limited to Small, Nonpolar Molecules 215
- The Rate of Simple Diffusion Is Directly Proportional to the Concentration Gradient 216

8.3 Facilitated Diffusion: Protein-Mediated Movement Down the Gradient 216

- Carrier Proteins and Channel Proteins Facilitate Diffusion by Different Mechanisms 217
- Carrier Proteins Alternate Between Two Conformational States 217
- Carrier Proteins Are Analogous to Enzymes in Their Specificity and Kinetics 217
- Carrier Proteins Transport Either One or Two Solutes 218
- The Erythrocyte Glucose Transporter and Anion Exchange Protein Are Examples of Carrier Proteins 218
- Channel Proteins Facilitate Diffusion by Forming Hydrophilic Transmembrane Channels 221

8.4 Active Transport: Protein-Mediated Movement Up the Gradient 225

- The Coupling of Active Transport to an Energy Source May Be Direct or Indirect 225
- Direct Active Transport Depends on Four Types of Transport ATPases 226
- Indirect Active Transport Is Driven by Ion Gradients 228

8.5 Examples of Active Transport 229

- Direct Active Transport: The Na^+/K^+ Pump Maintains Electrochemical Ion Gradients 229
- Indirect Active Transport: Sodium Symport Drives the Uptake of Glucose 230
- The Bacteriorhodopsin Proton Pump Uses Light Energy to Transport Protons 232

8.6 The Energetics of Transport 233

- For Uncharged Solutes, the ΔG of Transport Depends Only on the Concentration Gradient 233
- For Charged Solutes, the ΔG of Transport Depends on the Electrochemical Potential 234
- Summary of Key Points 235
- Problem Set 236

KEY TECHNIQUE Expression of Heterologous Membrane Proteins in Frog Oocytes 220

HUMAN CONNECTIONS Membrane Transport, Cystic Fibrosis, and the Prospects for Gene Therapy 222

Chemotrophic Energy Metabolism: Glycolysis and Fermentation 239

9.1 Metabolic Pathways 240

9.2 ATP: The Primary Energy Molecule in Cells 240

ATP Contains Two Energy-Rich Phosphoanhydride Bonds 240

ATP Hydrolysis Is Highly Exergonic Due to Several Factors 241

ATP Is Extremely Important in Cellular Energy Metabolism 242

9.3 Chemotrophic Energy Metabolism 244

Biological Oxidations Usually Involve the Removal of Both Electrons and Protons and Are Highly Exergonic 244

Coenzymes Such as NAD^+ Serve as Electron Acceptors in Biological Oxidations 245

Most Chemotrophs Meet Their Energy Needs by Oxidizing Organic Food Molecules 245

Glucose Is One of the Most Important Oxidizable Substrates in Energy Metabolism 246

The Oxidation of Glucose Is Highly Exergonic 246

Glucose Catabolism Yields Much More Energy in the Presence of Oxygen Than in Its Absence 246

Based on Their Need for Oxygen, Organisms Are Aerobic, Anaerobic, or Facultative 246

9.4 Glycolysis: ATP Generation Without the Involvement of Oxygen 247

Glycolysis Generates ATP by Catabolizing Glucose to Pyruvate 247

9.5 Fermentation 250

In the Absence of Oxygen, Pyruvate Undergoes Fermentation to Regenerate NAD^+ 250

Fermentation Taps Only a Fraction of the Substrate's Free Energy but Conserves That Energy Efficiently as ATP 252

Cancer Cells Ferment Glucose to Lactate Even in the Presence of Oxygen 252

9.6 Alternative Substrates for Glycolysis 253

Other Sugars and Glycerol Are Also Catabolized by the Glycolytic Pathway 253

Polysaccharides Are Cleaved to Form Sugar Phosphates That Also Enter the Glycolytic Pathway 254

9.7 Gluconeogenesis 255

9.8 The Regulation of Glycolysis and Gluconeogenesis 259

Key Enzymes in the Glycolytic and Gluconeogenic Pathways Are Subject to Allosteric Regulation 259

Fructose-2,6-Bisphosphate Is an Important Regulator of Glycolysis and Gluconeogenesis 260

9.9 Novel Roles for Glycolytic Enzymes 261

Summary of Key Points 262

Problem Set 263

KEY TECHNIQUE Using Isotopic Labeling to Determine the Fate of Atoms in a Metabolic Pathway 256

HUMAN CONNECTIONS What Happens to the Sugar? 258

Chemotrophic Energy Metabolism: Aerobic Respiration 266

10.1 Cellular Respiration: Maximizing ATP Yields 267

Aerobic Respiration Yields Much More Energy than Fermentation Does 267

Respiration Includes Glycolysis, Pyruvate Oxidation, the Citric Acid Cycle, Electron Transport, and ATP Synthesis 267

10.2 The Mitochondrion: Where the Action Takes Place 267

Mitochondria Are Often Present Where the ATP Needs Are Greatest 269

Are Mitochondria Interconnected Networks Rather than Discrete Organelles? 269

The Outer and Inner Membranes Define Two Separate Compartments and Three Regions 270

Mitochondrial Functions Occur in or on Specific Membranes and Compartments 271

In Bacteria, Respiratory Functions Are Localized to the Plasma Membrane and the Cytoplasm 273

10.3 The Citric Acid Cycle: Oxidation in the Round 274

Pyruvate Is Converted to Acetyl Coenzyme A by Oxidative Decarboxylation 275

The Citric Acid Cycle Begins with the Entry of Acetate as Acetyl CoA 275

Two Oxidative Decarboxylations Then Form NADH and

Release CO_2 276

Direct Generation of GTP (or ATP) Occurs at One Step in the Citric Acid Cycle 276

The Final Oxidative Reactions of the Citric Acid Cycle Generate FADH_2 and NADH 276

Summing Up: The Products of the Citric Acid Cycle Are CO_2 , ATP, NADH, and FADH_2 278

Several Citric Acid Cycle Enzymes Are Subject to Allosteric Regulation 279

The Citric Acid Cycle Also Plays a Central Role in the Catabolism of Fats and Proteins 279

The Citric Acid Cycle Serves as a Source of Precursors for Anabolic Pathways 282

The Glyoxylate Cycle Converts Acetyl CoA to Carbohydrates 282

10.4 Electron Transport: Electron Flow from

Coenzymes to Oxygen 284

The Electron Transport System Conveys Electrons from Reduced Coenzymes to Oxygen 284

The Electron Transport System Consists of Five Kinds of Carriers 285

The Electron Carriers Function in a Sequence Determined by Their Reduction Potentials 286

Most of the Carriers Are Organized into Four Large Respiratory Complexes 288

The Respiratory Complexes Move Freely Within the Inner Membrane 290

10.5 The Electrochemical Proton Gradient:

Key to Energy Coupling 292

Electron Transport and ATP Synthesis Are Coupled Events 292

Coenzyme Oxidation Pumps Enough Protons to Form Three ATP Molecules per NADH and Two ATP Molecules per FADH_2 293

The Chemiosmotic Model Is Affirmed by an Impressive Array of Evidence 293

10.6 ATP Synthesis: Putting It All Together 295

F₁ Particles Have ATP Synthase Activity 295

Proton Translocation Through F_o Drives ATP Synthesis by F₁ 297

ATP Synthesis by F_oF₁ Involves Physical Rotation of the Gamma Subunit 298

The Chemiosmotic Model Involves Dynamic Transmembrane Proton Traffic 300

10.7 Aerobic Respiration: Summing It All Up 301

The Maximum ATP Yield of Aerobic Respiration Is 38 ATP Molecules per Glucose 302

Aerobic Respiration Is a Highly Efficient Process 303

Summary of Key Points 303

Problem Set 304

KEY TECHNIQUE Visualizing Cellular Structures with Three-Dimensional Electron Microscopy 272

HUMAN CONNECTIONS A Diet Worth Dying For? 296

11 Phototrophic Energy Metabolism: Photosynthesis 307

11.1 An Overview of Photosynthesis 308

The Energy Transduction Reactions Convert Solar Energy to Chemical Energy 308

The Carbon Assimilation Reactions Fix Carbon by Reducing Carbon Dioxide 308

The Chloroplast Is the Photosynthetic Organelle in Eukaryotic Cells 310

Chloroplasts Are Composed of Three Membrane Systems 310

11.2 Photosynthetic Energy Transduction I: Light Harvesting 313

Chlorophyll Is Life's Primary Link to Sunlight 313

Accessory Pigments Further Expand Access to Solar Energy 314

Light-Gathering Molecules Are Organized into Photosystems and Light-Harvesting Complexes 315

Oxygenic Phototrophs Have Two Types of Photosystems 316

11.3 Photosynthetic Energy Transduction II: NADPH Synthesis 316

Photosystem II Transfers Electrons from Water to a Plastoquinone 316

The Cytochrome *b₆/f* Complex Transfers Electrons from a Plastoquinol to Plastocyanin 319

Photosystem I Transfers Electrons from Plastocyanin to Ferredoxin 319

Ferredoxin-NADP⁺ Reductase Catalyzes the Reduction of NADP⁺ 319

11.4 Photosynthetic Energy Transduction III: ATP Synthesis 322

The ATP Synthase Complex Couples Transport of Protons Across the Thylakoid Membrane to ATP Synthesis 322

Cyclic Photophosphorylation Allows a Photosynthetic Cell to Balance NADPH and ATP Synthesis 322

A Summary of the Complete Energy Transduction System 323

Bacteria Use a Photosynthetic Reaction Center and Electron Transport System Similar to Those in Plants 323

11.5 Photosynthetic Carbon Assimilation I: The Calvin Cycle 324

Carbon Dioxide Enters the Calvin Cycle by Carboxylation of Ribulose-1,5-Bisphosphate 325

3-Phosphoglycerate Is Reduced to Form Glyceraldehyde-3-Phosphate 325

Regeneration of Ribulose-1,5-Bisphosphate Allows Continuous Carbon Assimilation 327

The Complete Calvin Cycle and Its Relation to Photosynthetic Energy Transduction 327

11.6 Regulation of the Calvin Cycle 328

The Calvin Cycle Is Highly Regulated to Ensure Maximum Efficiency 328

Rubisco Activase Regulates Carbon Fixation by Rubisco 328

11.7 Photosynthetic Carbon Assimilation II: Carbohydrate Synthesis 329

Glucose-1-Phosphate Is Synthesized from Triose Phosphates 329

The Biosynthesis of Sucrose Occurs in the Cytosol 330

The Biosynthesis of Starch Occurs in the Chloroplast Stroma 330

Photosynthesis Also Produces Reduced Nitrogen and Sulfur Compounds 330

11.8 Rubisco's Oxygenase Activity Decreases Photosynthetic Efficiency 331

The Glycolate Pathway Returns Reduced Carbon from Phosphoglycolate to the Calvin Cycle 331

C₄ Plants Minimize Photorespiration by Confining Rubisco to Cells Containing High Concentrations of CO₂ 333

CAM Plants Minimize Photorespiration and Water Loss by Opening Their Stomata Only at Night 335

Summary of Key Points 336

Problem Set 337

KEY TECHNIQUE Determining Absorption and Action Spectra via Spectrophotometry 312

HUMAN CONNECTIONS How do Plants Put on Sunscreen? 320

12 The Endomembrane System 338

12.1 The Endoplasmic Reticulum 339

The Two Basic Kinds of Endoplasmic Reticulum Differ in Structure and Function 340

Rough ER Is Involved in the Biosynthesis and Processing of Proteins 340

Smooth ER Is Involved in Drug Detoxification, Carbohydrate Metabolism, Calcium Storage, and Steroid Biosynthesis 341

The ER Plays a Central Role in the Biosynthesis of Membranes 343

12.2 The Golgi Apparatus 343

The Golgi Apparatus Consists of a Series of Membrane-Bounded Cisternae 343

Two Models Account for the Flow of Lipids and Proteins Through the Golgi Apparatus 344

12.3 Roles of the ER and Golgi Apparatus in Protein Glycosylation 345

Initial Glycosylation Occurs in the ER 345

Further Glycosylation Occurs in the Golgi Apparatus 346

12.4 Roles of the ER and Golgi Apparatus in Protein Trafficking 348

ER-Specific Proteins Contain Retention and Retrieval Tags 348

Golgi Apparatus Proteins May Be Sorted According to the Lengths of Their Membrane-Spanning Domains 349

Targeting of Soluble Lysosomal Proteins to Endosomes and Lysosomes Is a Model for Protein Sorting in the TGN 349

12.5 Exocytosis and Endocytosis: Transporting Material Across the Plasma Membrane 351

Secretory Pathways Transport Molecules to the Exterior of the Cell 351

Exocytosis Releases Intracellular Molecules Outside the Cell 352

Endocytosis Imports Extracellular Molecules by Forming Vesicles from the Plasma Membrane 353

12.6 Coated Vesicles in Cellular Transport Processes 360

Clathrin-Coated Vesicles Are Surrounded by Lattices Composed of Clathrin and Adaptor Protein 360

The Assembly of Clathrin Coats Drives the Formation of Vesicles from the Plasma Membrane and TGN 361

COPI- and COPII-Coated Vesicles Travel Between the ER and Golgi Apparatus Cisternae 362

SNARE Proteins Mediate Fusion Between Vesicles and Target Membranes 362

12.7 Lysosomes and Cellular Digestion 364

Lysosomes Isolate Digestive Enzymes from the Rest of the Cell 364

Lysosomes Develop from Endosomes 364

Lysosomal Enzymes Are Important for Several Different Digestive Processes 365

Lysosomal Storage Diseases Are Usually Characterized by the Accumulation of Indigestible Material 367

12.8 The Plant Vacuole: A Multifunctional Organelle 368

12.9 Peroxisomes 368

Most Peroxisomal Functions Are Linked to Hydrogen Peroxide Metabolism 369

Plant Cells Contain Types of Peroxisomes Not Found in Animal Cells 370

Peroxisome Biogenesis Can Occur by Division of Preexisting Peroxisomes or by Vesicle Fusion 370

Summary of Key Points 371

Problem Set 372

KEY TECHNIQUE Visualizing Vesicles at the Cell Surface Using Total Internal Reflection (TIRF) Microscopy 354

HUMAN CONNECTIONS It's All in the Family 357

13 Cytoskeletal Systems 375

13.1 Major Structural Elements of the Cytoskeleton 376

Eukaryotes Have Three Basic Types of Cytoskeletal Elements 376

Bacteria Have Cytoskeletal Systems That Are Structurally Similar to Those in Eukaryotes 376

The Cytoskeleton Is Dynamically Assembled and Disassembled 376

13.2 Microtubules 378

Two Types of Microtubules Are Responsible for Many Functions in the Cell 378

Tubulin Heterodimers Are the Protein Building Blocks of Microtubules 378

Microtubules Can Form as Singlets, Doublets, or Triplets 379

Microtubules Form by the Addition of Tubulin Dimers at Their Ends 379

Addition of Tubulin Dimers Occurs More Quickly at the Plus Ends of Microtubules 381

Drugs Can Affect the Assembly and Stability of Microtubules 381

GTP Hydrolysis Contributes to the Dynamic Instability of Microtubules 382

Microtubules Originate from Microtubule-Organizing Centers Within the Cell 383

MTOCs Organize and Polarize Microtubules Within Cells 384

Microtubule Stability Is Tightly Regulated in Cells by a Variety of Microtubule-Binding Proteins 386

13.3 Microfilaments 388

Actin Is the Protein Building Block of Microfilaments 389

Different Types of Actin Are Found in Cells 389

G-Actin Monomers Polymerize into F-Actin Microfilaments 389

Specific Drugs Affect Polymerization of Microfilaments 390

Cells Can Dynamically Assemble Actin into a Variety of Structures 390

Actin-Binding Proteins Regulate the Polymerization, Length, and Organization of Microfilaments 390

Proteins That Link Actin to Membranes 393

Phospholipids and Rho Family GTPases Regulate Where and When Actin-Based Structures Assemble 394

13.4 Intermediate Filaments 396

Intermediate Filament Proteins Are Tissue Specific 397

Intermediate Filaments Assemble from Fibrous Subunits 398

Intermediate Filaments Confer Mechanical Strength on Tissues 398

The Cytoskeleton Is a Mechanically Integrated Structure 399

Summary of Key Points 399

Problem Set 400

KEY TECHNIQUE Studying the Dynamic Cytoskeleton 386

HUMAN CONNECTIONS When Actin Kills 395

14 Cellular Movement: Motility and Contractility 401

14.1 Microtubule-Based Movement Inside Cells: Kinesins and Dyneins 403

Motor Proteins Move Cargoes Along MTs During Axonal Transport 403

Classic Kinesins Move Toward the Plus Ends of Microtubules 404

Kinesins Are a Large Family of Proteins 404

Dyneins Are Found in Axonemes and the Cytosol 404

Microtubule Motors Direct Vesicle Transport and Shape the Endomembrane System 408

14.2 Microtubule-Based Cell Motility: Cilia and Flagella 408

Cilia and Flagella Are Common Motile Appendages of Eukaryotic Cells 408

Cilia and Flagella Consist of an Axoneme Connected to a Basal Body 409

Doublet Sliding Within the Axoneme Causes Cilia and Flagella to Bend 410

14.3 Microfilament-Based Movement Inside Cells: Myosins 411

Myosins Are a Large Family of Actin-Based Motors with Diverse Roles in Cell Motility 411

Many Myosins Move Along Actin Filaments in Short Steps 413

14.4 Microfilament-Based Motility: Muscle Cells in Action 413

Skeletal Muscle Cells Contain Thin and Thick Filaments 413

Sarcomeres Contain Ordered Arrays of Actin, Myosin, and Accessory Proteins 414

The Sliding-Filament Model Explains Muscle Contraction 416

Cross-Bridges Hold Filaments Together, and ATP Powers Their Movement 418
The Regulation of Muscle Contraction Depends on Calcium 418
The Coordinated Contraction of Cardiac Muscle Cells Involves Electrical Coupling 421
Smooth Muscle Is More Similar to Nonmuscle Cells than to Skeletal Muscle 422

14.5 Microfilament-Based Motility in Nonmuscle Cells 423

Cell Migration via Lamellipodia Involves Cycles of Protrusion, Attachment, Translocation, and Detachment 423
Chemotaxis Is a Directional Movement in Response to a Graded Chemical Stimulus 425
Amoeboid Movement Involves Cycles of Gelation and Solation of Actin 425
Actin-Based Motors Move Components Within the Cytosol of Some Cells 426

Summary of Key Points 426

Problem Set 427

KEY TECHNIQUE Watching Motors Too Small to See 406

HUMAN CONNECTIONS Dyneins Help Us Tell Left from Right 412

15 Beyond the Cell: Cell Adhesions, Cell Junctions, and Extracellular Structures 429

15.1 Cell-Cell Junctions 430

Adhesive Junctions Link Adjoining Cells 430
Transient Cell-Cell Adhesions Are Important for Many Cellular Events 433
Tight Junctions Prevent the Movement of Molecules Across Cell Layers 434
Gap Junctions Allow Direct Electrical and Chemical Communication Between Cells 438

15.2 The Extracellular Matrix of Animal Cells 439

Collagens Are Responsible for the Strength of the Extracellular Matrix 439
Elastins Impart Elasticity and Flexibility to the Extracellular Matrix 440
Collagen and Elastin Fibers Are Embedded in a Matrix of Proteoglycans 441
Free Hyaluronate Lubricates Joints and Facilitates Cell Migration 443
Adhesive Glycoproteins Anchor Cells to the Extracellular Matrix 443
Fibronectins Bind Cells to the ECM and Guide Cellular Movement 443
Laminins Bind Cells to the Basal Lamina 444
Integrins Are Cell Surface Receptors That Bind ECM Components 444
The Dystrophin/Dystroglycan Complex Stabilizes Attachments of Muscle Cells to the ECM 448

15.3 The Plant Cell Surface 449

Cell Walls Provide a Structural Framework and Serve as a Permeability Barrier 449
The Plant Cell Wall Is a Network of Cellulose Microfibrils, Polysaccharides, and Glycoproteins 449
Cell Walls Are Synthesized in Several Discrete Stages 450
Plasmodesmata Permit Direct Cell-Cell Communication Through the Cell Wall 451

Summary of Key Points 452

Problem Set 453

HUMAN CONNECTIONS The Costly Effects of Weak Adhesion 435

KEY TECHNIQUE Building an ECM from Scratch 446

16 The Structural Basis of Cellular Information: DNA, Chromosomes, and the Nucleus 455

16.1 Chemical Nature of the Genetic Material 456

The Discovery of DNA Led to Conflicting Proposals Concerning the Chemical Nature of Genes 456
Avery Showed That DNA Is the Genetic Material of Bacteria 457
Hershey and Chase Showed That DNA Is the Genetic Material of Viruses 457
RNA Is the Genetic Material in Some Viruses 459

16.2 DNA Structure 461

Chargaff's Rules Reveal That $A = T$ and $G = C$ 461
Watson and Crick Discovered That DNA Is a Double Helix 462
DNA Can Be Interconverted Between Relaxed and Supercoiled Forms 464
The Two Strands of a DNA Double Helix Can Be Denatured and Renatured 466

16.3 DNA Packaging 467

Bacteria Package DNA in Bacterial Chromosomes and Plasmids 467
Eukaryotes Package DNA in Chromatin and Chromosomes 470
Nucleosomes Are the Basic Unit of Chromatin Structure 470
A Histone Octamer Forms the Nucleosome Core 471
Nucleosomes Are Packed Together to Form Chromatin Fibers and Chromosomes 471
Changes in Histones and Chromatin Remodeling Proteins Can Alter Chromatin Packing 473
Chromosomal DNA Contains Euchromatin and Heterochromatin 474
Some Heterochromatin Plays a Structural Role in Chromosomes 474
Chromosomes Can Be Identified by Unique Banding Patterns 474
Eukaryotic Chromosomes Contain Large Amounts of Repeated DNA Sequences 475
Eukaryotes Package Some of Their DNA in Mitochondria and Chloroplasts 477

16.4 The Nucleus 478

A Double-Membrane Nuclear Envelope Surrounds the Nucleus 478
Molecules Enter and Exit the Nucleus Through Nuclear Pores 480
The Nucleus Is Mechanically Integrated with the Rest of the Cell 483
Chromatin Is Located Within the Nucleus in a Nonrandom Fashion 484
The Nucleolus Is Involved in Ribosome Formation 484

Summary of Key Points 486

Problem Set 486

KEY TECHNIQUE FISHing for Specific Sequences 468

HUMAN CONNECTIONS Lamins and Premature Aging 485

17 DNA Replication, Repair, and Recombination 488

17.1 DNA Replication 489

DNA Synthesis Occurs During S Phase 489
DNA Replication Is Semiconservative 489
DNA Replication Is Usually Bidirectional 491
Replication Initiates at Specialized DNA Elements 494
DNA Polymerases Catalyze the Elongation of DNA Chains 495
DNA Is Synthesized as Discontinuous Segments That Are Joined Together by DNA Ligase 498
In Bacteria, Proofreading Is Performed by the 3' → 5' Exonuclease Activity of DNA Polymerase 499

RNA Primers Initiate DNA Replication 500
The DNA Double Helix Must Be Locally Unwound During
Replication 502
DNA Unwinding and DNA Synthesis Are Coordinated on Both Strands
via the Replisome 503
Eukaryotes Disassemble and Reassemble Nucleosomes as Replication
Proceeds 503
Telomeres Solve the DNA End-Replication Problem 505

17.2 DNA Damage and Repair 508

Mutations Can Occur Spontaneously During Replication 508
Mutagens Can Induce Mutations 510
DNA Repair Systems Correct Many Kinds of DNA Damage 512

17.3 Homologous Recombination and Mobile Genetic Elements 517

Homologous Recombination Is Initiated by Double-Stranded Breaks in
DNA 517
Transposons Are Mobile Genetic Elements 519
Transposons Differ Based on Their Autonomy and Mechanism of
Movement 519
Bacterial Transposons Can Be Composite or Non-composite 520
Eukaryotes Also Have Transposons 521
Summary of Key Points 521
Problem Set 521

KEY TECHNIQUE The Polymerase Chain Reaction (PCR) 500

HUMAN CONNECTIONS Children of the Moon 514

18 Gene Expression: I. The Genetic Code and Transcription 523

18.1 The Genetic Code and the Directional Flow of Genetic Information 524

Transcription and Translation Involve Many of the Same Components
in Prokaryotes and Eukaryotes 524
Where Transcription and Translation Occur Differs in Prokaryotes and
Eukaryotes 524
In Some Cases RNA Is Reversed Transcribed into DNA 526
The Genetic Code 527
The Genetic Code Is a Triplet Code 529
The Genetic Code Is Degenerate and Nonoverlapping 530
Messenger RNA Guides the Synthesis of Polypeptide Chains 531
The Codon Dictionary Was Established Using Synthetic RNA Polymers
and Triplets 532
Of the 64 Possible Codons in Messenger RNA, 61 Encode Amino
Acids 532
The Genetic Code Is (Nearly) Universal 533

18.2 Mechanisms of Transcription 534

Transcription Involves Four Stages: RNA Polymerase Binding, Initiation,
Elongation, and Termination 534
Bacterial Transcription Involves σ Factor Binding, Initiation, Elongation,
and Termination 534
Transcription in Eukaryotic Cells Has Additional Complexity Compared
with Prokaryotes 540
RNA Polymerases I, II, and III Carry Out Transcription in the Eukaryotic
Nucleus 540
Three Classes of Promoters Are Found in Eukaryotic Nuclear Genes, One
for Each Type of RNA Polymerase 541
General Transcription Factors Are Involved in the Transcription of All
Nuclear Genes 543
Elongation, Termination, and RNA Cleavage Are Involved in Completing
Eukaryotic RNA Synthesis 544

18.3 RNA Processing and Turnover 545

The Nucleolus Is Involved in Ribosome Formation 545
Ribosomal RNA Processing Involves Cleavage of Multiple rRNAs from a
Common Precursor 546
Transfer RNA Processing Involves Removal, Addition, and Chemical
Modification of Nucleotides 548
Messenger RNA Processing in Eukaryotes Involves Capping, Addition of
Poly(A), and Removal of Introns 549
Spliceosomes Remove Introns from Pre-mRNA 551
Some Introns Are Self-Splicing 552
The Existence of Introns Permits Alternative Splicing and Exon
Shuffling 553
Cells Localize Nuclear RNAs in Several Types of Processing Centers 554
Nucleic Acid Editing Allows Sequences to Be Altered 554
The C-Terminal Domain of RNA Polymerase II Coordinates RNA
Processing 555
Most mRNA Molecules Have a Relatively Short Life Span 555
The Abundance of mRNA Allows Amplification of Genetic
Information 555
Summary of Key Points 556
Problem Set 556

KEY TECHNIQUE Hunting for DNA-Protein Interactions 536

19 Gene Expression: II. Protein Synthesis and Sorting 559

19.1 Translation: The Cast of Characters 560

Ribosomes Carry Out Polypeptide Synthesis 560
Transfer RNA Molecules Bring Amino Acids to the Ribosome 561
Aminoacyl-tRNA Synthetases Link Amino Acids to the Correct Transfer
RNAs 564
Messenger RNA Brings Polypeptide Coding Information to the
Ribosome 565
Protein Factors Are Required for Translational Initiation, Elongation,
and Termination 566

19.2 The Mechanism of Translation 566

Translational Initiation Requires Initiation Factors, Ribosomal Subunits,
mRNA, and Initiator tRNA 566
Chain Elongation Involves Cycles of Aminoacyl tRNA Binding, Peptide
Bond Formation, and Translocation 570
Most mRNAs Are Read by Many Ribosomes Simultaneously 572
Termination of Polypeptide Synthesis Is Triggered by Release Factors
That Recognize Stop Codons 572
Polypeptide Folding Is Facilitated by Molecular Chaperones 572
Protein Synthesis Typically Utilizes a Substantial Fraction of a Cell's
Energy Budget 574
A Summary of Translation 575

19.3 Mutations and Translation 575

Suppressor tRNAs Overcome the Effects of Some Mutations 576
Nonsense-Mediated Decay and Nonstop Decay Promote the Destruction
of Defective mRNAs 577

19.4 Posttranslational Processing 577

19.5 Protein Targeting and Sorting 580

Cotranslational Import Allows Some Polypeptides to Enter the ER as
They Are Being Synthesized 580
The Signal Recognition Particle (SRP) Attaches the Ribosome-mRNA-
Polypeptide Complex to the ER Membrane 584
Protein Folding and Quality Control Take Place Within the ER 585
Proteins Released into the ER Lumen Are Routed to the Golgi Apparatus,
Secretory Vesicles, Lysosomes, or Back to the ER 585

Stop-Transfer Sequences Mediate the Insertion of Integral Membrane Proteins 586
Posttranslational Import Is an Alternative Mechanism for Import into the ER Lumen 586
Posttranslational Import Across Two Membranes Allows Some Polypeptides to Enter Mitochondria and Chloroplasts 588
Summary of Key Points 590
Problem Set 591

KEY TECHNIQUE Protein Localization Using Fluorescent Fusion Proteins 578

HUMAN CONNECTIONS To Catch a Killer: The Problem of Antibiotic Resistance in Bacteria 583

20 The Regulation of Gene Expression 593

20.1 Bacterial Gene Regulation 594

Catabolic and Anabolic Pathways Are Regulated Through Induction and Repression, Respectively 594
The Genes Involved in Lactose Catabolism Are Organized into an Inducible Operon 595
The *lac* Operon Is Negatively Regulated by the *lac* Repressor 595
Studies of Mutant Bacteria Revealed How the *lac* Operon Is Organized 597
Catabolite Activator Protein (CAP) Positively Regulates the *lac* Operon 599
The *lac* Operon Is an Example of the Dual Control of Gene Expression 599
The Structure of the *lac* Repressor/Operator Complex Confirms the Operon Model 600
The Genes Involved in Tryptophan Synthesis Are Organized into a Repressible Operon 600
Sigma Factors Determine Which Sets of Genes Can Be Expressed 600
Attenuation Allows Transcription to Be Regulated After the Initiation Step 601
Riboswitches Allow Transcription and Translation to Be Controlled by Small-Molecule Interactions with RNA 603
The CRISPR/Cas System Protects Bacteria Against Viral Infection 604

20.2 Eukaryotic Gene Regulation: Genomic Control 605

Multicellular Eukaryotes Are Composed of Numerous Specialized Cell Types 605
Eukaryotic Gene Expression Is Regulated at Five Main Levels 605
The Cells of a Multicellular Organism Usually Contain the Same Set of Genes 606
Gene Amplification and Deletion Can Alter the Genome 608
DNA Rearrangements Can Alter the Genome 609
Chromatin Decondensation Is Involved in Genomic Control 610
DNA Methylation Is Associated with Inactive Regions of the Genome 611

20.3 Eukaryotic Gene Regulation: Transcriptional Control 615

Different Sets of Genes Are Transcribed in Different Cell Types 615
Proximal Control Elements Lie Close to the Promoter 616
Enhancers and Silencers Are DNA Elements Located at Variable Distances from the Promoter 617
Coactivators Mediate the Interaction Between Regulatory Transcription Factors and the RNA Polymerase Complex 619
Multiple DNA Control Elements and Transcription Factors Act in Combination 620
DNA-Binding and Activation Domains of Regulatory Transcription Factors Are Functionally Separable 620
Several Common Types of Transcription Factors Bind to DNA and Activate Transcription 621

DNA Response Elements Coordinate the Expression of Nonadjacent Genes 623
Steroid Hormone Receptors Act as Transcription Factors That Bind to Hormone Response Elements 623
CREBs and STATs Are Examples of Transcription Factors Activated by Phosphorylation 624
The Heat-Shock Response Element Coordinates Stress Responses 625
Homeotic Genes Encode Transcription Factors That Regulate Embryonic Development 625

20.4 Eukaryotic Gene Regulation: Posttranscriptional Control 627

Control of RNA Processing and Nuclear Export Follows Transcription 627
Translation Rates Can Be Controlled by Initiation Factors and Translational Repressors 627
Translation Can Also Be Controlled by Regulation of mRNA Degradation 629
RNA Interference Utilizes Small RNAs to Silence Gene Expression 630
MicroRNAs Produced by Normal Cellular Genes Silence the Translation of mRNAs 631
Piwi-interacting RNAs Are Small Regulatory RNAs That Protect the Germline of Eukaryotes 634
Long Noncoding RNAs Play a Variety of Roles in Eukaryotic Gene Regulation 634
Posttranslational Control Involves Modifications of Protein Structure, Function, and Degradation 634
Ubiquitin Targets Proteins for Degradation by Proteasomes 635
A Summary of Eukaryotic Gene Regulation 636
Summary of Key Points 637
Problem Set 638

HUMAN CONNECTIONS The Epigenome: Methylation and Disease 613

KEY TECHNIQUE Gene Knockdown via RNAi 632

21 Molecular Biology Techniques for Cell Biology 640

21.1 Analyzing and Manipulating DNA 640

Gel Electrophoresis Allows DNA to Be Separated by Size 641
Restriction Endonucleases Cleave DNA Molecules at Specific Sites 642
Restriction Mapping Can Characterize DNA 643
Restriction Endonucleases Can Identify Methylated DNA 644
Southern Blotting Identifies Specific DNAs from a Mixture 644
Restriction Enzymes Allow Production of Recombinant DNA 645
PCR Is Widely Used to Clone Genes 646
Genomic and cDNA Libraries Are Both Useful for DNA Cloning 646
Rapid Procedures Exist for DNA Sequencing 651

21.2 Analyzing Genomes 654

- Whole Genomes Can Be Sequenced 654
- Comparative Genomics Allows Comparison of Genomes and Genes Within Them 656
- The Field of Bioinformatics Helps to Decipher Genomes 657
- Tiny Differences in Genome Sequence Distinguish People from One Another 660

21.3 Analyzing RNA and Proteins 663

- Several Techniques Allow Detection of mRNAs in Time and Space 663
- The Transcription of Thousands of Genes Can Be Assessed Simultaneously 664
- Proteins Can Be Studied Using Electrophoresis 665
- Antibodies Can Be Used to Study Specific Proteins 665
- Proteins Can Be Isolated by Size, Charge, or Affinity 667
- Proteins Can Be Identified from Complex Mixtures Using Mass Spectrometry 668
- Protein Function Can Be Studied Using Molecular Biology Techniques 669
- Protein-Protein Interactions Can Be Studied in a Variety of Ways 670

21.4 Analyzing and Manipulating Gene Function 672

- Transgenic Organisms Carry Foreign Genes That Are Passed On to Subsequent Generations 672
- Transcriptional Reporters Are Useful for Studying Regulation of Gene Expression 674
- The Role of Specific Genes Can Be Assessed By Identifying Mutations and by Knockdown 674
- Genetic Engineering Can Produce Valuable Proteins That Are Otherwise Difficult to Obtain 677
- Food Crops Can Be Genetically Modified 678
- Gene Therapies Are Being Developed for the Treatment of Human Diseases 678
- Summary of Key Points 679
- Problem Set 680

KEY TECHNIQUE DNA Cloning 648

HUMAN CONNECTIONS More Than Your Fingertips: Identifying Genetic “Fingerprints” 662

22 Signal Transduction Mechanisms: I. Electrical and Synaptic Signaling in Neurons 682

22.1 Neurons and Membrane Potential 683

- Neurons Are Specially Adapted for the Transmission of Electrical Signals 683
- Neurons Undergo Changes in Membrane Potential 684

- Resting Membrane Potential Depends on Ion Concentrations and Selective Membrane Permeability 685
- The Nernst Equation Describes the Relationship Between Membrane Potential and Ion Concentration 686
- Steady-State Ion Concentrations Affect Resting Membrane Potential 686
- The Goldman Equation Describes the Combined Effects of Ions on Membrane Potential 687

22.2 Electrical Excitability and the Action Potential 688

- Patch Clamping and Molecular Biological Techniques Allow Study of Single Ion Channels 688
- Specific Domains of Voltage-Gated Channels Act as Sensors and Inactivators 688
- Action Potentials Propagate Electrical Signals Along an Axon 692
- Action Potentials Involve Rapid Changes in the Membrane Potential of the Axon 692
- Action Potentials Result from the Rapid Movement of Ions Through Axonal Membrane Channels 692
- Action Potentials Are Propagated Along the Axon Without Losing Strength 694
- The Myelin Sheath Acts Like an Electrical Insulator Surrounding the Axon 695

22.3 Synaptic Transmission and Signal Integration 697

- Neurotransmitters Relay Signals Across Nerve Synapses 697
- Elevated Calcium Levels Stimulate Secretion of Neurotransmitters from Presynaptic Neurons 700
- Secretion of Neurotransmitters Involves the Docking and Fusion of Vesicles with the Plasma Membrane 701
- Neurotransmitters Are Detected by Specific Receptors on Postsynaptic Neurons 703
- Neurotransmitters Must Be Inactivated Shortly After Their Release 704
- Postsynaptic Potentials Integrate Signals from Multiple Neurons 704
- Summary of Key Points 705
- Problem Set 706

KEY TECHNIQUE Patch Clamping 690

HUMAN CONNECTIONS In the Search for the Fountain of Youth, Are People Paying for Poison? 702

23 Signal Transduction Mechanisms: II. Messengers and Receptors 708

23.1 Chemical Signals and Cellular Receptors 709

- Chemical Signaling Involves Several Key Components 709
- Receptor Binding Involves Quantitative Interactions Between Ligands and Their Receptors 710
- Cells Can Amplify Signals Once They Are Received 711
- Cell-Cell Signals Act Through a Limited Number of Receptors and Signal Transduction Pathways 711

23.2 G Protein–Coupled Receptors 713

- G Protein–Coupled Receptors Act via Hydrolysis of GTP 713
- Cyclic AMP Is a Second Messenger Whose Production Is Regulated by Some G Proteins 715
- Disruption of G Protein Signaling Causes Human Disease 716
- Many G Proteins Act Through Inositol Trisphosphate and Diacylglycerol 717
- The Release of Calcium Ions Is a Key Event in Many Signaling Processes 718

23.3 Protein Kinase-Associated Receptors 722

Growth Factors Often Bind Protein Kinase-Associated Receptors 723
Receptor Tyrosine Kinases Aggregate and Undergo

Autophosphorylation 723

Receptor Tyrosine Kinases Initiate a Signal Transduction Cascade
Involving Ras and MAP Kinase 724

The Key Steps in RTK Signaling Can Be Dissected Using Mutants 725
Receptor Tyrosine Kinases Activate a Variety of Other Signaling

Pathways 727

Other Growth Factors Transduce Their Signals via Receptor Serine-
Threonine Kinases 727

23.4 Putting It All Together: Signal Integration 728

Scaffolding Complexes Can Facilitate Cell Signaling 729

Different Signaling Pathways Are Integrated Through Crosstalk 730

23.5 Hormones and Other Long-Range Signals 731

Hormones Can Be Classified by Their Chemical Properties 731

The Endocrine System Controls Multiple Signaling Pathways to
Regulate Glucose Levels 731

Steroid Hormones Bind Hormones in the Cytosol and Carry Them into
the Nucleus 733

Gases Can Act as Cell Signals 734

Summary of Key Points 736

Problem Set 737

KEY TECHNIQUE Calcium Indicators and Ionophores 721

HUMAN CONNECTIONS The Gas That Prevents a Heart Attack 735

24 The Cell Cycle and Mitosis 738

24.1 Overview of the Cell Cycle 739

24.2 Nuclear and Cell Division 743

Mitosis Is Subdivided into Prophase, Prometaphase, Metaphase,
Anaphase, and Telophase 743

The Mitotic Spindle Is Responsible for Chromosome Movements During
Mitosis 746

Cytokinesis Divides the Cytoplasm 749

Bacteria and Eukaryotic Organelles Divide in a Different Manner from
Eukaryotic Cells 752

24.3 Regulation of the Cell Cycle 753

Cell Cycle Length Varies Among Different Cell Types 753

Cell Cycle Progression Is Controlled at Several

Key Transition Points 754

Cell Fusion Experiments and Cell Cycle Mutants Identified Molecules
That Control the Cell Cycle 755

Progression Through the Cell Cycle Is Controlled by Cyclin-Dependent
Kinases (Cdks) 755

Cdk-Cyclin Complexes Are Regulated 756

The Anaphase-Promoting Complex Allows Exit from Mitosis 758

Checkpoint Pathways Monitor Key Steps in the Cell Cycle 758

Putting It All Together: The Cell Cycle Regulation Machine 761

24.4 Growth Factors and Cell Proliferation 762

Stimulatory Growth Factors Activate the Ras Pathway 762

Stimulatory Growth Factors Can Also Activate the PI 3-Kinase–Akt
Pathway 763

Inhibitory Growth Factors Act Through Cdk Inhibitors 764

24.5 Apoptosis 764

Apoptosis Is Triggered by Death Signals or Withdrawal of Survival
Factors 765

Summary of Key Points 767

Problem Set 768

KEY TECHNIQUE Measuring Cells Millions at a Time 740

HUMAN CONNECTIONS What Do Ethnobotany and Cancer Have in
Common? 750

25 Sexual Reproduction, Meiosis, and Genetic Recombination 770

25.1 Sexual Reproduction 771

Sexual Reproduction Produces Genetic Variety 771

Gametes Are Haploid Cells Specialized for Sexual
Reproduction 771

25.2 Meiosis 771

The Life Cycles of Sexual Organisms Have Diploid and Haploid
Phases 772

Meiosis Converts One Diploid Cell into Four Haploid Cells 772

Meiosis I Produces Two Haploid Cells That Have Chromosomes
Composed of Sister Chromatids 773

Meiosis II Resembles a Mitotic Division 778

Defects in Meiosis Lead to Nondisjunction 779

Sperm and Egg Cells Are Generated by Meiosis Accompanied by Cell
Differentiation 781

Meiotic Maturation of Oocytes Is Tightly Regulated 782

25.3 Genetic Variability: Segregation and Assortment of Alleles 784

Meiosis Generates Genetic Diversity 784

Information Specifying Recessive Traits Can Be Present Without Being
Displayed 784

Alleles of Each Gene Segregate from Each Other During Gamete
Formation 785

Alleles of Each Gene Segregate Independently of the Alleles of Other
Genes 786

Chromosome Behavior Explains the Laws of Segregation and
Independent Assortment 787

The DNA Molecules of Homologous Chromosomes Have Similar Base
Sequences 787

25.4 Genetic Variability: Recombination and Crossing Over 789

Chromosomes Contain Groups of Linked Genes That Are Usually
Inherited Together 789

Homologous Chromosomes Exchange Segments During Crossing
Over 789

Gene Locations Can Be Mapped by Measuring Recombination
Frequencies 791

25.5 Genetic Recombination in Bacteria and Viruses 792

Co-infection of Bacterial Cells with Related Bacteriophages Can Lead to
Genetic Recombination 792

Recombination in Bacteria Can Occur via Transformation or
Transduction 793

Conjugation Is a Modified Sexual Activity That Facilitates Genetic
Recombination in Bacteria 793

25.6 Mechanisms of Homologous Recombination 796

DNA Breakage and Exchange Underlie Homologous Recombination Between Chromosomes 796

The Synaptonemal Complex Facilitates Homologous Recombination During Meiosis 796

Homologous Recombination Between Chromosomes Relies on High-Fidelity DNA Repair 797

Summary of Key Points 799

Problem Set 799

HUMAN CONNECTIONS When Meiosis Goes Awry 780

KEY TECHNIQUE Using Mendel's Rules to Predict Human Disease 790

26 Cancer Cells 802

26.1 How Cancers Arise 802

Tumors Arise When the Balance Between Cell Division and Cell Differentiation or Death Is Disrupted 803

Cancer Cell Proliferation Is Anchorage Independent and Insensitive to Population Density 804

Cancer Cells Are Immortalized by Mechanisms That Maintain Telomere Length 804

Defects in Signaling Pathways, Cell Cycle Controls, and Apoptosis Contribute to Cancer 804

Cancer Arises Through a Multistep Process Involving Initiation, Promotion, and Tumor Progression 805

26.2 How Cancers Spread 806

Angiogenesis Is Required for Tumors to Grow Beyond a Few Millimeters in Diameter 806

Blood Vessel Growth Is Controlled by a Balance Between Angiogenesis Activators and Inhibitors 807

Cancer Cells Spread by Invasion and Metastasis 808

Changes in Cell Adhesion, Motility, and Protease Production Promote Metastasis 808

Relatively Few Cancer Cells Survive the Voyage Through the Bloodstream 809

Blood Flow and Organ-Specific Factors Determine Sites of Metastasis 809

The Immune System Influences the Growth and Spread of Cancer Cells 810

The Tumor Microenvironment Influences Tumor Growth, Invasion, and Metastasis 810

26.3 What Causes Cancer? 811

Epidemiological Data Have Allowed Many Causes of Cancer to Be Identified 811

Many Chemicals Can Cause Cancer, Often After Metabolic Activation in the Liver 812

DNA Mutations Triggered by Chemical Carcinogens Lead to Cancer 812
Ionizing and Ultraviolet Radiation Also Cause DNA Mutations That Lead to Cancer 813

Viruses and Other Infectious Agents Trigger the Development of Some Cancers 814

26.4 Oncogenes and Tumor Suppressor Genes 815

Oncogenes Are Genes Whose Products Can Trigger the Development of Cancer 815

Proto-oncogenes Are Converted into Oncogenes by Several Distinct Mechanisms 815

Most Oncogenes Encode Components of Growth-Signaling Pathways 817

Tumor Suppressor Genes Are Genes Whose Loss or Inactivation Can Lead to Cancer 820

The *RB* Tumor Suppressor Gene Was Discovered by Studying Families with Hereditary Retinoblastoma 821

The *p53* Tumor Suppressor Gene Is the Most Frequently Mutated Gene in Human Cancers 822

The *APC* Tumor Suppressor Gene Encodes a Protein That Inhibits the Wnt Signaling Pathway 823

Inactivation of Some Tumor Suppressor Genes Leads to Genetic Instability 824

Cancers Develop by the Stepwise Accumulation of Mutations Involving Oncogenes and Tumor Suppressor Genes 825

Epigenetic Changes in Gene Expression Influence the Properties of Cancer Cells 828

Summing Up: Carcinogenesis and the Hallmarks of Cancer 828

26.5 Diagnosis, Screening, and Treatment 829

Cancer Is Diagnosed by Microscopic and Molecular Examination of Tissue Specimens 830

Screening Techniques for Early Detection Can Prevent Cancer Deaths 830

Surgery, Radiation, and Chemotherapy Are Standard Treatments for Cancer 831

Using the Immune System to Target Cancer Cells 831

Molecular Targeting Can Attack Cancer Cells More Specifically Than Chemotherapy 834

Cancer Treatments Can Be Tailored to Individual Patients 834

Summary of Key Points 834

Problem Set 835

KEY TECHNIQUE Targeting Molecules in the Fight Against Cancer 832

HUMAN CONNECTIONS Molecular Sleuthing in Cancer Diagnosis 826

APPENDIX Visualizing Cells and Molecules 837

ANSWER KEY TO CONCEPT CHECK AND KEY TECHNIQUE BOX QUESTIONS 862

GLOSSARY 869

PHOTO, ILLUSTRATION, AND TEXT CREDITS 895

INDEX 901

Key Technique

- Chapter 1:** Using Immunofluorescence to Identify Specific Cell Components
- Chapter 2:** Determining the Chemical Fingerprint of a Cell Using Mass Spectrometry
- Chapter 3:** Using X-ray Crystallography to Determine Protein Structure
- Chapter 4:** Using Centrifugation to Isolate Organelles
- Chapter 5:** Measuring How Molecules Bind One Another Using Isothermal Titration Calorimetry
- Chapter 6:** Determining K_m and V_{max} Using Enzyme Assays
- Chapter 7:** SDS–Polyacrylamide Gel Electrophoresis (SDS-PAGE) of Membrane Proteins
- Chapter 8:** Expression of Heterologous Membrane Proteins in Frog Oocytes
- Chapter 9:** Using Isotopic Labeling to Determine the Fate of Atoms in a Metabolic Pathway
- Chapter 10:** Visualizing Cellular Structures with Three-Dimensional Electron Microscopy
- Chapter 11:** Determining Absorption and Action Spectra via Spectrophotometry
- Chapter 12:** Visualizing Vesicles at the Cell Surface Using Total Internal Reflection Microscopy (TIRF)
- Chapter 13:** Studying the Dynamic Cytoskeleton
- Chapter 14:** Watching Motors Too Small to See
- Chapter 15:** Building an ECM from Scratch
- Chapter 16:** FISHing for Specific Sequences
- Chapter 17:** The Polymerase Chain Reaction
- Chapter 18:** Hunting for DNA-Protein Interactions
- Chapter 19:** Protein Localization Using Fluorescent Fusion Proteins
- Chapter 20:** Gene Knockdown via RNAi
- Chapter 21:** DNA Cloning
- Chapter 22:** Patch Clamping
- Chapter 23:** Calcium Indicators and Ionophores
- Chapter 24:** Measuring Cells Millions at a Time (FACS Analysis)
- Chapter 25:** Using Mendel’s Rules to Predict Human Disease
- Chapter 26:** “Rational” Drugs in the Fight Against Cancer

Human Connections

- Chapter 1:** The Immortal Cells of Henrietta Lacks (The origin of the first human cultured cell line)
- Chapter 2:** Taking a Deeper Look—Magnetic Resonance Imaging (MRI) (How an MRI can image human tissues)
- Chapter 3:** Aggregated Proteins and Alzheimer Disease (Protein misfolding and human disease)
- Chapter 4:** When Cellular “Breakdown” Breaks Down (Diseases caused by lysosome dysfunction)
- Chapter 5:** The “Potential” of Food to Provide Energy (Calorie contents of foods)
- Chapter 6:** ACE Inhibitors: Enzyme Activity as the Difference Between Life and Death (Blood pressure medication based on snake venom)
- Chapter 8:** Membrane Transport, Cystic Fibrosis, and the Prospects for Gene Therapy
- Chapter 9:** What Happens to the Sugar? (Dietary food intake and metabolism)
- Chapter 10:** A Diet Worth Dying For? (The dangers of using uncouplers such as DNP to lose weight)
- Chapter 11:** How Do Plants Put on Sunscreen? (How the plant xanthophyll cycle dissipates excess solar energy)
- Chapter 12:** It’s All in the Family (LDL receptors, cholesterol uptake, hypercholesterolemia)
- Chapter 13:** When Actin Kills (*Listeria* infection and actin polymerization)
- Chapter 14:** Dyneins Help Us Tell Left from Right (Motors and left-right axis specification)
- Chapter 15:** The Costly Effects of Weak Adhesion (Blistering diseases of the skin)
- Chapter 16:** Lamins and Premature Aging (Progeria and the nuclear envelope)
- Chapter 17:** Children of the Moon (Xeroderma pigmentosum and DNA repair)
- Chapter 19:** To Catch a Killer: The Problem of Antibiotic Resistance in Bacteria
- Chapter 20:** The Epigenome: Methylation and Disease (Rett syndrome and imprinting disorders)
- Chapter 21:** More Than Your Fingertips: Identifying Genetic “Fingerprints” (STRs in genetic identification)
- Chapter 22:** In the Search for the Fountain of Youth, Are People Paying for Poison? (Cosmetic uses of *Botulinum* toxin)
- Chapter 23:** How to Prevent a Heart Attack (Nitric oxide signaling and vasoconstriction)
- Chapter 24:** What do Ethnobotany and Cancer Have in Common? (Taxol and cancer treatment)
- Chapter 25:** When Meiosis Goes Awry (Down syndrome and nondisjunction)
- Chapter 26:** Molecular Sleuthing in Cancer Diagnosis (Molecular analysis of breast cancer)

Cells are the fundamental building blocks of life on this planet. Despite their tiny size, they are wonders of intricacy. Moment by moment, the cells of our bodies are engaged in a dazzling repertoire of biochemical events, including signaling processes, transmission of genetic information, and delicately choreographed movements. Helping our students to appreciate the complexities of this amazing cellular world lies at the heart of our goals as authors of *Becker's The World of the Cell*. The motivations that drove our colleague, Wayne Becker, to write the first edition of this book continue to drive us today. We believe that our students should have biology textbooks that are clearly written, make the subject matter relevant, and help them to appreciate not only how much we already know about cell biology but also the exciting journey of continued discovery that lies ahead. We, as authors, have an extensive history of teaching undergraduate courses in cell biology and related areas, and we treasure our contact with students as one of the most rewarding aspects of being faculty members.

The amazing success of modern cell biology creates both exciting opportunities and central challenges in our teaching. How can we capture the core elements of modern cell biology in a way that draws our students in without overwhelming them? The enormous profusion of information challenges us to keep *Becker's World of the Cell* up to date while ensuring that it remains both manageable in length and readily comprehensible to students studying cell and molecular biology for the first time.

This ninth edition engages students with new innovative features in each chapter and an exciting, fresh look. In addition, a major goal of this edition has been to reorganize the presentation of several key topics. We hope students and instructors will find that the greater emphasis on molecular biology earlier in the text integrates even better with learning about other aspects of cellular function, just as molecular approaches have become ever more tightly integrated into the everyday work of modern cell biologists.

As with the previous editions, we remain committed to three central goals. First, our primary goal is to introduce students to the fundamental principles that guide cellular organization and function. Second, we want students to understand some of the key scientific evidence that has helped us formulate these central concepts. And third, we have sought to accomplish these goals in a book of manageable length that is easily read and understood by beginning cell biology students—and that still fits in their backpacks! We have therefore been necessarily selective both in the examples chosen to illustrate key concepts and in the quantity of scientific evidence included. The result is an update that we hope students and instructors will be as excited about as we are.

What's New in This Edition

- **New look:** The art program has been updated throughout the book to give drawings a more dynamic and inviting look. Striking new chapter-opening images draw students into the topic of each chapter. In addition, new figures based on molecular structures have been added in several key locations.
- **Reorganization of molecular biology material:** The molecular genetics section of the text has been completely reorganized. These chapters now come earlier in the book and contain substantial new material on chromosomes, mechanisms of DNA mutation and repair, and mobile genetics elements.
- **New chapter on molecular techniques:** This new chapter focuses on the tools that have revolutionized molecular biology and biochemistry—the key technologies cell biologists use to analyze and manipulate DNA, genomes, RNA and proteins, and gene function.
- **Reorganization of materials on cell signaling, cell division, and the cell cycle:** Because the molecular genetics material comes earlier in the book, topics that relate to regulation of gene and protein expression are now more naturally integrated into the discussion of cell signaling and cell cycle control. These topics now come immediately before the chapter on cancer.

KEY TECHNIQUE

Determining the Chemical Fingerprint of a Cell Using Mass Spectrometry

A scientist preparing an injection for mass spectrometry.

Figure 2A-1 A Mass Spectrometer.

PROBLEM: In cell biology, scientists typically study processes that involve changes in the chemistry of the cell, such as cell growth and division. Researchers often want to be able to identify small molecules in a cellular extract, or they may want to determine the chemical structure of a new compound. How is such analysis accomplished?

Key Tools: Mass spectrometer; a sample to be analyzed; a computer to analyze the results.

Details: Mass spectrometry can identify chemical compounds within a sample with high resolution, differentiating between

- **Key Techniques boxes in every chapter:** Twenty-six Key Techniques boxes are integrated throughout the text, demonstrating how cutting-edge technologies can be used to answer key questions in cell biology. See page 17 for a complete list.

Human Connections

ACE INHIBITORS: ENZYME ACTIVITY AS THE DIFFERENCE BETWEEN LIFE AND DEATH

Figure 6A-1 The Brazilian Pit Viper (*Bothrops jararaca*).

The Brazilian pit viper (*Bothrops jararaca*) (Figure 6A-1) spots its prey and strikes, injecting venom into a mouse. The venom releases a cocktail of peptides that widen the blood vessels in the mouse and cause a drastic drop in blood pressure. This

by the kidneys, it cleaves a specific peptide bond in an inactive protein known as *angiotensinogen*, releasing an N-terminal 10-amino acid peptide called *angiotensin I*.

Angiotensin I travels through the bloodstream to the pulmonary artery and lungs, where it is modified by the action of another enzyme, known as *angiotensin-converting enzyme (ACE)*, which is abundant in the capillaries of the lungs. ACE cleaves two amino acids from the C-terminus of *angiotensin I* to convert *angiotensin I* to *angiotensin II*. *Angiotensin II* normally raises blood pressure if it has fallen too low by acting in the kidneys to return more sodium and water to the blood. Having more water in the blood increases blood volume, and, because the vascular system is closed, this results in increased blood pressure. *Angiotensin II* is also a vasoconstrictor and will cause blood vessels to narrow, further increasing blood pressure.

Like many regulatory systems in the body, there is a regulatory pathway in place that has an opposite effect of *angiotensin II*. This system utilizes the peptide hormone *bradykinin*, which is a vasodilator. This causes blood vessels to relax and become wider. *Bradykinin* binds to receptors. ACE is involved in regulating

- **Human Connections boxes:** Twenty-four Human Connections boxes emphasize the relevance of cell biology to human health and society, from the story of Henrietta Lacks and the HeLa cell line to the relevance of biochemical pathways to our diet, to the many cases in which cell biology helps us diagnose and treat human disease. See page 17 for a complete list.
- **Concept Check questions:** Each main section of a chapter ends with a Concept Check question. These questions provide students with numerous opportunities to assess their understanding as they read. Answers to these questions are available at the back of the book.
- **Quantitative questions in every end-of-chapter Problem Set:** New and existing quantitative questions are flagged at the end of each chapter to encourage students to work on developing their ability to perform calculations or to interpret quantitative information.
- **Content updates:** Updated information highlighting the most recent advances in cell and molecular biology has been added throughout the book (see Content Highlights of the Ninth Edition below).

Pearson Mastering Biology®

Pearson Mastering Biology is an innovative online homework, tutorial, and assessment system that delivers self-paced tutorials with individualized coaching, hints, and feedback. The Mastering system helps instructors and students with customizable, easy-to-assign, and automatically graded assignments.

Integrated links in every chapter of the textbook point students to a variety of interactive online materials, including the following:

- More than 100 tutorials and activities that teach complex cell processes
- More than 100 molecular and microscopy videos, which provide vivid images of cellular processes
- 17 3-D Structure Tutorials that allow students to manipulate molecular structures, with assessment activities
- 240 Reading Quiz questions, which encourage students to read before class
- Many end-of-chapter questions and problems that are now assignable and automatically gradable
- Test Bank questions for every chapter
- The eText, also available through Pearson Mastering Biology, which provides both access to the complete textbook and powerful interactive and customizable functions. In addition, a custom textbook option is available, allowing bundling of selected chapters chosen by the instructor to suit a particular course.
- A suite of Instructor Resources, including PowerPoint lecture outlines containing all the figures and photos.
- Learning Catalytics is a “bring your own device” assessment and active classroom system that expands the possibilities for student engagement beyond standard clickers. Using Learning Catalytics, instructors can deliver a wide range of auto-gradable or open-ended questions that test content knowledge and build critical thinking skills.

Content Highlights of the Ninth Edition

Updated material and new information have been added throughout the book in both the text and art. Topics that have been altered, updated, or added include the following:

Chapter 1: A revised section on expression of genetic information in cells is presented much earlier in the textbook to integrate with other aspects of modern cell biology. New overview figure showing information expression in cells. New figures to introduce chromatography and electrophoresis. Described superresolution microscopy and photoactivatable GFP. Earlier introduction of immunoprecipitation, RNA sequencing, transcriptomics, DNA microarrays. New figure showing a DNA microarray. Revised figure showing importance of model organisms in cell biology research. Expanded discussion on the use on antibodies and immunofluorescence to identify cell components. Large new section describing experimental design, the null hypothesis, and experimental variables. Discussed use of mutants, reverse genetics, biochemical inhibitors in cell biology research.

Chapter 2: Clarified properties of acids and bases with respect to functional groups. Introduced use of mass spectrometry to identify and characterize chemical compounds. Reinforced concepts of valence, the octet rule, and lone electron pairs to explain the shape and polarity of water molecules. Introduced glycobiology sooner. New figure to clarify concept of membrane semipermeability. New figure with updated three-dimensional structure of insulin. Introduced use of MRI to study the chemistry of tissues in the human body.

Chapter 3: Emphasized protein denaturation in the context of human protein-folding diseases. Introduced base stacking in discussion of hydrophobic effects on DNA structure. New figure highlighting β -sheet structure in a fibrous protein. Emphasized differences between storage and structural polysaccharides. Improved description of linear versus Haworth illustrations of monosaccharide structure.

Chapter 4: New showcase figures of animal and plant cells. New section describing proposed origin of cells, the RNA world, liposomes (with accompanying figure), and new figure on Miller's classic 1953 experiments on the abiotic origins of organic molecules. Moved discussion of the endosymbiont theory forward to this chapter to accompany introduction of mitochondria and chloroplasts. Discussion of centrifugation to study organelles also introduced much earlier. New figure showing updated ribosome structure. New figure showing scanning EM of human chromosomes. New figure showing immunofluorescent detection of cytoskeletal elements.

Chapter 5: More emphasis on open versus closed systems. Revised discussion of bioluminescence versus fluorescence. Expanded discussion of aequorin and GFP. Expanded discussion of oxidation and reduction reaction and relevance to cellular metabolism. Improved definition of free energy. Introduction of isothermal titration calorimetry to determine thermodynamic parameters in biological processes.

Chapter 6: New figure to show binding of substrate to specific amino acids in an enzyme active site. Revised explanation of inorganic and organic catalysts and earlier introduction of trans fats. More emphasis on why we study enzyme kinetics. Better explanation of cooperativity using hemoglobin as an example. More emphasis on substrate analogues and inhibitors in treatment of human disease.

Chapter 7: Updated discussion of lipid nomenclature. Added information on ABO blood groups to illustrate membrane glycoproteins in a relevant human example. More emphasis on fungal and bacterial sterols. Introduced common abbreviations for fatty acid chain length and saturation. Noted differential charges on membrane monolayers.

Chapter 8: New figure and updated information on structure and selectivity of the aquaporin water channel. Introduced bacterial aquaglyceroporins. Revised and simplified discussion of electrochemical potential. New paragraph introducing the Na^+ /glucose symporter with an explanation of how glucose phosphorylation in the cell keeps the transmembrane free glucose concentration far from equilibrium. Clarified

discussion of osmosis and added intravenous phosphate-buffered saline as a relevant example. Noted how cells can have multiple types of glucose transporters using intestinal cells as an example. Simplified the figure showing *Halobacterium* proton pump to highlight essential details. Updated the structure of the CFTR chloride channel.

Chapter 9: New section describing the Warburg effect and aerobic glycolysis in cancer cells, with a new figure describing how PET scans exploit this to visualize tumors in the body. Better explanations of energy-rich bonds in phosphorylated compounds and charge repulsion/resonance stabilization in ATP. Revised figure showing phosphate group transfer reactions. Described experimental use of frog muscle tissue to elucidate steps in glycolysis. More emphasis on how cells use fermentation to ensure a steady supply of NAD^+ in anaerobic conditions. Better description of allosteric effectors of glycolysis.

Chapter 10: Expanded discussion of mitochondrial morphology based on EM tomography and updated figures to show new information on cristae junctions. Expanded discussion of respiratory complexes I to IV, with new figure showing accurate molecular models. New figure panel with a ribbon model showing the molecular structure of the ATP synthase complex. More emphasis on the difference between oxidative and substrate-level phosphorylation. Expanded discussion of experimental evidence that isolated F_1 particles can synthesize ATP. Simplified figure showing the binding change model for ATP synthesis.

Chapter 11: New figure showing autofluorescence of a *Spirogyra* chloroplast. New figure with accurate molecular model of the 16 subunits of the RuBisCO enzyme. Completely updated figure of the structure of the bacterial photosynthetic reaction center. Clarified the meaning of carbon fixation and introduced this concept sooner. Improved figure showing folded membranes in photosynthetic cyanobacteria. Clarified figure showing energy capture by photosynthetic accessory pigments. More emphasis on the difference between cyclic and noncyclic electron flow.

Chapter 12: Simplified the overview figures based on student and instructor feedback. Introduced the dangers of synergistic effects of alcohol and barbiturates. More experimental detail regarding Palade's classic work showing protein synthesis and secretion. Described Rothman's work on vesicle trafficking. Emphasized yeast as a model organism. More emphasis on the differences between rough and smooth ER. New figure contrasting the stationary cisternae with the cisternal maturation models in Golgi transport. New information about lysosomal storage diseases, peroxisome biogenesis, multivesicular endosomes, and newly proposed roles for cellular caveolae.

Chapter 13: Added material on septins to the introductory section and a new EM figure showing the density of cytoskeletal elements. Added new molecular renderings of bacterial cytoskeletal proteins. Significantly improved the coverage of centrioles and γ -tubulin ring complexes/centrosomes, including new figure panels. Updated the schematic of Tau to be more realistic and added panels showing the effects of Tau

overexpression. New material on EB1 and +-TIP proteins, including new figure panels. Updated coverage of Rho family GTPases and their regulation.

Chapter 14: Revised discussion of motors to remove mixed anatomical metaphors. Added a new figure on motors based on molecular structures. Added major new material on dyneins based on new molecular structures, and figures were revised accordingly. Added brief mention of SAS-6/cartwheels in basal bodies. Added an essentially new figure on kinesin movement along microtubules. Added new figure on microtubule sliding in the axoneme and made major improvements to figures dealing with cilia and flagella. Added a new molecular structure panel to the thin filament figure.

Chapter 15: Reorganized and streamlined the first section of the chapter (cell-cell adhesion). Material on the glycocalyx and blood typing was moved to Chapter 7. Figures on cadherins, tight junctions, and desmosomes were upgraded and consolidated. Added a major new figure on the assembled extracellular matrix. Added more images of fibronectin and costameres.

Chapter 16: The molecular genetics sections were completely reorganized. Many elements were moved to the new molecular techniques chapter (Chapter 21). Added extra material on Avery's experiments, RNA as the genetic material in TMV, and more on Watson/Crick/Franklin. Added material on base stacking and DNA double helix structure. Moved some material on chromatin regulation to this chapter. The heterochromatin discussion was reorganized to feature centromeres and telomeres in a more coherent fashion and to better set up the discussion of repeated DNA sequences. Added material on G bands and karyotyping. Revised treatment of variable number tandem repeats (VNTRs), short tandem repeats (STRs), etc.

Chapter 17: Cell cycle material was moved to Chapter 24. Added Taylor's experiments to the semiconservative replication section. Added material and a figure on origins of replication and replication bubbles. Added material on DNA polymerase proofreading. Performed a major upgrade to the replisome section, including a major new figure. Major upgrades to the mutation section to include DNA adducts and intercalating agents, and the DNA error repair section to include photorepair, major upgrades and clarifications to base excision repair, nucleotide excision repair, and SOS repair/translesion synthesis. Major upgrade to the recombination section to include synthesis-dependent strand annealing (SDSA) and modernized treatments of the double-stranded break model for homologous recombination and Holliday junction resolution. Added material on DNA-only transposons.

Chapter 18: Added new comparison of bacterial and eukaryotic transcription. Added new table on types of RNA. Added nucleolus material to this chapter (moved from Chapter 16). Added more detail on phosphorylation of the polymerase II CTD in initiation and coordination of mRNA processing. Added "scrunching" to section on bacterial initiation and updated the section on bacterial elongation with more discussion based on structural data. Added new section clarifying RNA polymerase proofreading.

Chapter 19: Added more material on ribosome biogenesis and ribosome structure. Wobble coverage was expanded, and a new figure added. Added significant new coverage of eukaryotic translational initiation, poly(A)-binding protein, etc. Enhanced coverage of IRESs. Added a section on polyribosomes. Added a significant new section on chaperones. Added new paragraph on posttranslational processing of insulin (with figure). Added discussion on making multipass transmembrane proteins, plus a new figure panel.

Chapter 20: Improved explanation of what "on" and "off" mean for gene expression. Added major new material on CRISPR/Cas. Added discussion of somatic hypermutation to the section on immunoglobulin genes. Yeast mating type switching was moved to the gene silencing discussion. Added new material on X chromosome inactivation. Added material to section on domain swapping of transcription factors. Added new sections on piRNAs and long, noncoding RNAs. Added a new figure on DNA methylation and on the structure of the eukaryotic 26S proteasome.

Chapter 21: This is a new chapter that consolidates many molecular techniques from previous editions in one location, including material on genomes, restriction enzymes, detecting DNA methylation, dideoxy sequencing, nucleic acid blotting, recombinant DNA, cDNA, Ti plasmids, transgenic mice, mouse knockouts, microarrays, and the yeast two-hybrid method. Enhanced treatment of different types of DNA libraries. New nucleic acid material, including genome sequencing, the tree of life, sequence comparisons and databases, Human Genome Project data, systems biology, RFLP/STR analysis, RT-PCR, RNA in situ, transcriptional reporters, genome editing, TILLING, and CRISPR/Cas9. New protein material, including 2D gels, immunoblotting, chromatography, mass spectrometry for peptides, pulldowns, co-immunoprecipitation, and engineering of tagged proteins.

Chapter 22: Improved and streamlined the discussion of electrochemical potential, including a completely revised figure on the resting potential. Added to patch clamping material. Improved the treatment of channel inactivation in the main action potential figure. Added new paragraphs on optogenetics and NMDA receptors.

Chapter 23: More setup using a biological example familiar to students. Wnt receptors and cancer now deferred to Chapter 26. Added an overview of basic pathways to be discussed in detail and added a figure. Signaling crosstalk is now deferred until the end of the growth factor section, and a new figure was added. Added new section on K_d . Molecular structures of a GPCR and EGFR were added. Added to cholera discussion.

Chapter 24: This is a newly organized chapter, with material taken from Chapter 19 of the previous edition (mitosis, cytokinesis, DNA licensing, cell cycle control, apoptosis). Added more material on structure of kinetochores, midbodies, and abscission. Added material on bacterial and chloroplast division and FtsZ. Expanded and revised treatment of regulation of mitotic exit via the APC and spindle assembly checkpoint control which are now split into separate figures. Clarified coverage of checkpoints by segregating the discussion into its own section. Autoradiography problems updated to use BrdU instead.

Chapter 25: This is a new chapter, with material taken from Chapter 20 of the previous edition. Switched to purple/white flower color as main example from Mendel's work. Revised figure on genes, loci, alleles, etc. Updated gamete formation figure to more accurately reflect how polar bodies form in oocytes. Added more material on the synaptonemal complex and DNA repair proteins during recombination. Added new material on control of meiosis in amphibians and moved discussion of Masui's experiments on MPF from the cell cycle chapter (Chapter 24) to this chapter.

Chapter 26: Reorganized the introductory discussion of cancer. Improved discussion of cancer stem cells. Added new figures or part of figures: a colon polyp, chromosomal translocation in BCR-ABL, and genomic instability. Clarified the discussion of the two-hit hypothesis and loss of heterozygosity. Improved discussion of Wnt receptors/coreceptors. Added material on the Cancer Genome Atlas, GWAS, and sequencing of the genome of HeLa cells.

Appendix: Moved TIRF discussion to group it with light sheet and multiphoton microscopy. Removed X-ray crystallography because this is now covered in detail in the main text (Chapter 3). Added discussion of optogenetics.

Building on the Strengths of Previous Editions

We have retained and built upon the strengths of prior editions in four key areas:

1. The chapter organization focuses on main concepts.

- Each chapter is divided into sections that begin with a numbered *concept statement heading*, which summarizes the material and helps students focus on the main points to study and review.
- Chapters are written and organized to allow instructors to assign chapters and chapter sections in different sequences, making the book adaptable to a wide variety of course plans.
- Each chapter ends with a bulleted *Summary of Key Points* that briefly describes the main points covered in each section of the chapter.

2. The illustrations teach concepts at an appropriate level of detail.

- Many of the more complex figures incorporate *mini-captions* to help students grasp concepts more quickly by drawing their focus into the body of an illustration rather than depending solely on a separate figure legend to describe what is taking place.
- *Overview figures* outline complicated structures or processes in broad strokes and are followed by text and figures that present supporting details.
- Carefully selected micrographs showing key cellular structures are accompanied by scale bars to indicate magnification.

3. Important terminology is highlighted and defined in several ways.

- **Boldface type** is used to highlight the most important terms in each chapter, all of which are defined in the Glossary.
- *Italic type* is used to identify additional technical terms that are less important than boldfaced terms but significant in their own right. Occasionally, italics is also used to highlight important phrases or sentences.
- The Glossary includes definitions and page references for all boldfaced key terms and acronyms in every chapter—more than 1500 terms in all, a veritable dictionary of cell biology in its own right.

4. Each chapter helps students learn the process of science, not just facts.

- Text discussions emphasize the experimental evidence that underlies our understanding of cell structure and function, to remind readers that advances in cell biology, as in all branches of science, come not from lecturers in their classrooms or textbook authors at their computers but from researchers in their laboratories.
- The inclusion of a *Problem Set* at the end of each chapter reflects our conviction that we learn science not just by reading or hearing about it but by working with it. The problems are designed to emphasize understanding and application, rather than rote recall. Many are class-tested, having been selected from problem sets and exams we have used in our own courses.

Supplementary Learning Aids

For Instructors

Instructor Resources (available for download at www.pearsonglobaleditions.com/Hardin).
978-1-292-17770-0

Available to adopters, the Instructor Resources include the following:

- PowerPoint lecture tools, including lecture outlines containing all of the figures, photos, and embedded animations.
- JPEG images of all textbook figures and photos, including printer-ready transparency acetate masters.

Computerized Test Bank for *Becker's World of the Cell*
978-1-292-17772-4

The test bank provides more than 1000 multiple-choice, short-answer, and inquiry/activity questions.

We Welcome Your Comments and Suggestions

The ultimate test of any textbook is how effectively it helps instructors teach and students learn. We welcome feedback and suggestions from readers and will try to acknowledge all correspondence. Please send your comments, criticisms, and suggestions to the appropriate authors listed here.

ACKNOWLEDGMENTS

We want to acknowledge the contributions of the numerous people who have made this book possible. We are indebted especially to the many students whose words of encouragement catalyzed the writing of these chapters and whose thoughtful comments and criticisms have contributed much to the reader-friendliness of the text. Extending a long tradition started by Wayne Becker, many of these chapters are used every year in teaching second-semester Biocore students at the University of Wisconsin–Madison. These students continue to inspire us to do our very best.

We owe a special debt of gratitude to our colleagues, from whose insights and suggestions we have benefited greatly and borrowed freely. We especially thank Deb Pires and Ann Sturtevant for their work on many of the Human Connections boxes in this edition. We also acknowledge those who have contributed to previous editions of our textbooks, including David Deamer, Martin Poenie, Jane Reece, John Raasch, and Valerie Kish, as well as Peter Armstrong, John Carson, Ed Clark, Joel Goodman, David Gunn, Jeanette Natzle, Mary Jane Niles, Timothy Ryan, Beth Schaefer, Lisa Smit, David Spiegel, Akif Uzman, and Karen Valentine. Most important, we are grateful to Wayne Becker for his incisive writing and vision, which led to the creation of this book and which featured so prominently in previous editions, and to Lewis Kleinsmith, whose key contributions to the text, beginning with the 4th edition, have contributed so much to the book. We have tried to carry on their tradition of excellence. In addition, we want to express our appreciation to the many colleagues who graciously consented to contribute micrographs to this endeavor, as well as the authors and publishers who have kindly granted permission to reproduce copyrighted material.

Many reviewers have graciously provided helpful criticisms and suggestions at various stages of manuscript development

and revision. Their words of appraisal and counsel were gratefully received and greatly appreciated. Indeed, the extensive review process for each new edition is a significant feature of the book. Nonetheless, the final responsibility for what you read here remains ours, and you may confidently attribute to us any errors of omission or commission encountered in these pages.

We are also deeply indebted to the many publishing professionals whose consistent encouragement, hard work, and careful attention to detail contributed much to the clarity of both the text and the art. This edition in particular has required the unflagging efforts of a remarkable publishing team, including Anna Amato, Program Manager; Margaret Young, Project Manager; Sonia Divittorio, Mary Ann Murray, and Debbie Hardin, Senior Development Editors; Ginnie Simone Jutson, Executive Development Manager; Lauren Harp, Executive Marketing Manager; Ameer Mosley, Senior Marketing Manager; Alexander Helmintoller, Editorial Assistant; Joe Mochnick, Editorial Content Producer; Lee Ann Doctor, Editorial Media Producer; and Josh Frost, Executive Academic Editor.

Finally, we are grateful beyond measure to our families, students, and colleagues, without whose patience, understanding, and forbearance this book could not have been written.

Acknowledgments for the Global Edition

Pearson wishes to thank and acknowledge Shefali Sabharanjak for contributing to the Global Edition, Christiane Van den Branden, Vrije Universiteit Brussel, for contributing to and reviewing the Global Edition, and Kiran Paul and Asha Sharma for reviewing the Global Edition.

A Preview of Cell Biology

The **cell** is the basic unit of biology. Every organism either consists of cells or is itself a single cell. Therefore, it is only by understanding the structure and function of cells that we can appreciate both the capabilities and the limitations of living organisms, whether they are animals, plants, fungi, or microorganisms.

The field of cell biology is rapidly changing as scientists from a variety of related disciplines work together to gain a better understanding of how cells are constructed and how they carry out all the intricate functions necessary for life. Particularly significant is the dynamic nature of the cell. Cells are constantly changing; they have the capacity to grow, reproduce, and become specialized. In addition, once specialized, they have the ability to respond to stimuli and adapt to changes in the environment. The convergence of cytology, genetics, and biochemistry has made modern cell biology one of the most exciting and dynamic disciplines in all of biology. If this text helps you to appreciate the marvels and diversity of cellular functions and allows you to experience the excitement of discovery, then one of our main goals in writing this book for you will have been met.

In this introductory chapter, we will look briefly at the origin of cell biology as a discipline. Then we will consider the three main historical strands of cytology, genetics, and biochemistry that have formed our current understanding of what cells are and how they work. The chapter concludes with a brief discussion of the nature of knowledge itself by considering biological facts, the scientific method, experimental design, and the use of some common model organisms to answer important questions in modern cell biology.

1.1 The Cell Theory: A Brief History

The story of cell biology started to unfold more than 300 years ago, as European scientists began to focus their crude microscopes on a variety of biological material ranging from tree bark to bacteria to human sperm. One such scientist was Robert Hooke, Curator of Instruments for the Royal Society of London. In 1665, Hooke built a microscope and examined thin slices of cork. He saw a network of tiny boxlike compartments that reminded him of a honeycomb and called these little compartments *cells*, from the Latin word *cellula*, meaning “little room.”

What Hooke observed were not cells at all. Those empty boxlike compartments were formed by the cell walls of dead plant tissue, which is what cork is. However, Hooke would not have thought of these cells as dead because he did not understand that they could be alive! Although he noticed that cells in other plant tissues were filled with what he called “juices,” he concentrated instead on the more prominent cell walls of the dead cork cells that he had first encountered.

Advances in Microscopy Allowed Detailed Studies of Cells

Hooke’s observations were limited by the *magnification power* of his microscope, which enlarged objects to only 30 times (30×) their normal size. This made it difficult to learn much about the internal organization of cells. A few years later, Antonie van Leeuwenhoek, a Dutch textile merchant, produced small lenses that could magnify objects to almost 300 times (300×) their size. Using these superior lenses, van Leeuwenhoek became the first to observe living cells, including blood cells, sperm cells, bacteria, and single-celled organisms (algae and protozoa) found in pond water. He reported his observations to the Royal Society of London in a series of letters during the late 1600s. His detailed reports attest to both the high quality of his lenses and his keen powers of observation.

Two main factors restricted further understanding of the nature of cells. First, the microscopes of the day had limited *resolution (resolving power)*—the ability to see fine details of structure. Even van Leeuwenhoek’s superior instruments could push this limit only so far. The second factor was the descriptive nature of seventeenth-century biology. It was an age of observation, with little thought given to explaining the intriguing architectural details being discovered in biological materials.

More than a century passed before the combination of improved microscopes and more experimentally minded microscopists resulted in a series of developments that led to an understanding of the importance of cells in biological organization. By the 1830s, important optical improvements were made in lens quality and in the *compound microscope*, an instrument in which one lens (the eyepiece) magnifies the image created by a second lens (the objective). This allowed both higher magnification and better resolution. At that point, structures only 1 micrometer (μm) in size could be seen clearly.

The Cell Theory Applies to All Organisms

Aided by such improved lenses, the Scottish botanist Robert Brown found that every plant cell he looked at contained a rounded structure, which he called a *nucleus*, a term derived from the Latin word for “kernel.” In 1838, his German colleague Matthias Schleiden came to the important conclusion that all plant tissues are composed of cells and that an embryonic plant always arises from a single cell. A year later, German cytologist Theodor Schwann reported similar conclusions concerning animal tissue, thereby discrediting earlier speculations that plants and animals do not resemble each other structurally. These speculations arose because plant cell walls form conspicuous boundaries between cells that are readily visible even with a crude microscope, whereas individual animal cells, which lack cell walls, are much harder to distinguish in a tissue sample. However, when Schwann examined animal cartilage cells, he saw that they were unlike most other animal cells because they have boundaries that are well defined by thick deposits of collagen fibers. Thus, he became convinced of the fundamental similarity between plant and animal tissue. Based on his astute observations, Schwann developed a single unified theory of cellular organization. This theory has stood the test of time and continues to be the basis for our own understanding of the importance of cells and cell biology.

As originally postulated by Schwann in 1839, the **cell theory** had two basic principles:

1. All organisms consist of one or more cells.
2. The cell is the basic unit of structure for all organisms.

Less than 20 years later, a third principle was added. This grew out of Brown’s original description of nuclei, which Swiss botanist Karl Nägeli extended to include observations on the nature of cell division. By 1855 Rudolf Virchow, a German physiologist, concluded that cells arose only by the division of other, preexisting cells. Virchow encapsulated this conclusion in the now-famous Latin phrase *omnis cellula e cellula*, which in translation becomes the third principle of the modern cell theory:

3. All cells arise only from preexisting cells.

Thus, the cell is not only the basic unit of structure for all organisms but also the basic unit of reproduction. No wonder, then, that we must understand cells and their properties to appreciate all other aspects of biology. Because many of you have seen examples of “typical” cells in textbooks that may give the false impression that there are relatively few different types of cells, let’s take a look at a few examples of the diversity of cells that exist in our world (**Figure 1-1**).

Cells exist in a wide variety of shapes and sizes, ranging from filamentous fungal cells to spiral-shaped *Treponema* bacteria to the differently shaped cells of the human blood system (Figure 1-1a–c). Other cells have much more exotic shapes, such as the diatom and the protozoan shown in Figure 1-1d and e. Note how the two human single-celled gametes, the egg

Figure 1-1 Cells of the World. The diversity of cell types existing all around us includes the examples shown in this figure and thousands upon thousands more.

and the sperm, differ greatly in size and shape (Figure 1-1f). As in leaves, the green chlorophyll in a *Chlamydomonas* cell shows that these algae carry out photosynthesis (Figure 1-1g). Often, an appreciation of a cell's shape and structure gives clues about its function. For example, the spiral thickenings in the cell walls of plant xylem tissue give strength to these water-conducting vessels in wood (Figure 1-1h), and the highly branched cells of a human neuron allow it to interact with numerous other neurons (Figure 1-1i). In our studies throughout this textbook, we will see many other interesting examples of diversity in cell structure and function. First, though, let's examine the historical roots leading to the development of contemporary cell biology.

CONCEPT CHECK 1.1

What evidence led scientists to develop the basic principles of the cell theory? Note how technology played a role in its development.

1.2 The Emergence of Modern Cell Biology

Modern cell biology results from the weaving together of three different strands of biological inquiry—cytology, biochemistry, and genetics—into a single cord. As the timeline in **Figure 1-2** illustrates, each of the strands had its own historical origins, and each one makes unique and significant contributions to modern cell biology. Contemporary cell biologists must be adequately informed about all three strands, regardless of their own immediate interests.

Historically, the first of the strands to emerge was **cytology**, which is concerned primarily with cellular structure. In biological studies, you will often encounter words containing the Greek prefix *cyto-* or the suffix *-cyte*, both of which mean “hollow vessel” and refer to cells. Cytology had its origins more than three centuries ago and depended heavily on the light microscope for its initial impetus. The advent

Figure 1-2 The Cell Biology Timeline.

Although cytology, biochemistry, and genetics began as separate disciplines, they have increasingly merged since about 1925.

of electron microscopy and other advanced optical techniques has dramatically increased our understanding of cell structure and function.

The second strand represents the many contributions of **biochemistry** to our understanding of cellular structure and function. Most of the developments in this field have occurred

over the past 75 years, though the roots go back at least a century earlier. Especially important has been the development of laboratory techniques such as ultracentrifugation, chromatography, radioactive labeling, electrophoresis, and mass spectrometry for separating and identifying cellular components. You will encounter these and other techniques later in your

studies as you learn how specific details of cellular structure and function were discovered using these techniques.

The third strand contributing to the development of modern cell biology is **genetics**. Although the timeline for genetics stretches back more than 150 years, most of our present understanding has been gained within the past 75 years. An especially important discovery was the demonstration that, in all organisms, DNA (deoxyribonucleic acid) is the bearer of genetic information. It encodes the tremendous variety of proteins and RNA (ribonucleic acid) molecules responsible for most of the functional and structural features of cells. Recent accomplishments on the genetic strand include the sequencing of the entire **genome** (all of the DNA) of humans and those of other species and the *cloning* (production of genetically identical organisms) of mammals, including sheep, cattle, and cats.

Therefore, an understanding of present-day cell biology requires an appreciation of its diverse roots and the important contributions made by each of its component strands to our current understanding of what a cell is and what it can do. Each of the three historical strands of cell biology is discussed briefly here; a deeper appreciation of these historical strands will come in later chapters as we explore cells in detail. Keep in mind also that in addition to developments in cytology, biochemistry, and genetics, the field of cell biology has benefited greatly from advancements in other fields of study such as chemistry, physics, computer science, and engineering.

The Cytological Strand Deals with Cellular Structure

Strictly speaking, cytology is the study of cells. Historically, however, cytology has dealt primarily with cellular structure, mainly through the use of optical techniques. Here we will describe briefly some of the microscopy that is important in cell biology. (For more detailed discussion of microscopic techniques, see the Appendix.) Microscopy has been invaluable in helping cell biologists overcome a fundamental problem—the problem of small size.

Cellular Dimensions. One challenge involved in understanding cellular structure and organization is the fact that most cells and their organelles are too small to be seen by the unaided eye. The cellular structures that microscopists routinely deal with are measured using units that may not be familiar to you.

The **micrometer** (μm) is the most useful unit for expressing the size of cells and organelles. A micrometer (historically called a *micron*) is one-millionth of a meter (10^{-6} m). One inch equals approximately 25,000 μm . In general, bacterial cells are a few micrometers in diameter, and the cells of plants and animals are 10 to 20 times larger. Organelles such as mitochondria and chloroplasts tend to be a few micrometers in size and are thus comparable in size to whole bacterial cells. In general, if you can see it with a light microscope, you can express its dimensions conveniently in micrometers (**Figure 1-3a**).

Figure 1-3 The Worlds of the Micrometer and Nanometer. Illustrations show (a) typical cells and (b) common cellular structures.

The **nanometer** (nm) is the unit of choice for molecules and subcellular structures that are too small to be seen using the light microscope. A nanometer is one-billionth of a meter (10^{-9} m), so it takes 1000 nanometers to equal 1 micrometer. A ribosome has a diameter of about 25 to 30 nm. Other structures that can be measured conveniently in nanometers are cell membranes, microtubules, microfilaments, and DNA molecules (Figure 1-3b). A slightly smaller unit, the angstrom (Å), is used in cell biology when measuring dimensions within proteins and DNA molecules. An angstrom equals 0.1 nm, which is about the size of a hydrogen atom.

The Light Microscope. The **light microscope** was the earliest tool of the cytologists and continues to play an important role in our elucidation of cellular structure. Light microscopy allowed cytologists to identify membrane-bounded structures such as *nuclei*, *mitochondria*, and *chloroplasts* within a variety of cell types. Such structures are called *organelles* (“little organs”) and are prominent features of most plant and animal (but not bacterial) cells. (Chapter 4 presents an overview of organelle types, and later chapters investigate their structure and function in more detail.)

Other significant advancements in microscopy include the development of the microtome in the mid-1800s and the availability of various dyes and stains at about the same time. A *microtome* is an instrument developed for rapid and efficient preparation of very thin (several μm) tissue slices of biological samples. Many of the dyes important for staining and identifying subcellular structures were developed in the latter half of the nineteenth century by German industrial chemists working with coal tar derivatives. Together with improved optics and more sophisticated lenses, these developments extended light microscopy to the physical limits of resolution imposed by the size of the wavelengths of visible light.

As used in microscopy, the **limit of resolution** refers to how far apart adjacent objects must be to appear as separate entities. For example, if the limit of resolution of a microscope is 400 nm, objects must be at least 400 nm apart to be recognizable as separate entities. The smaller the limit of resolution, the greater the **resolving power**, or ability to see fine details of structure, of the microscope. Therefore, a better microscope might have a resolution of 200 nm, meaning that objects only 200 nm apart can be distinguished from each other.

Because of the physical nature of light itself, the theoretical limit of resolution for the light microscope is approximately half of the size of the wavelength of light used for illumination, allowing maximum magnifications of about 1000–1400 \times . For *visible light* (wavelengths of 400–700 nm), the limit of resolution would be about 200–350 nm. **Figure 1-4** illustrates the useful range of the light microscope and compares its resolving power with that of the human eye and the electron microscope, which is discussed shortly.

The type of microscopy described thus far is called *bright-field microscopy* because white light is passed directly through a specimen that is either stained or unstained and the background (the field) is illuminated. A significant limitation of this approach is that specimens often must be chemically fixed (preserved), dehydrated, embedded in paraffin or plastic for slicing into thin sections, and stained to highlight otherwise transparent features. Fixed and stained specimens are no

Figure 1-4 Relative Resolving Power of the Human Eye, the Light Microscope, and the Electron Microscope. Notice that the vertical axis is on a logarithmic scale to accommodate the wide range of sizes shown.

longer alive, and therefore features observed by this method could be distortions caused by slide preparation processes that are not typical of the living cells.

Specialized Light Microscopes. To overcome the limitations of a brightfield microscope, a variety of special optical techniques have been developed for observing living cells directly. These techniques include phase-contrast microscopy, differential interference contrast microscopy, fluorescence microscopy, and confocal microscopy. In **Table 1-1**, you can see images taken using each of these techniques and compare them with the images seen with brightfield microscopy for both unstained and stained specimens. Because these
