A male satin bowerbird decorates his "bower" by painting its component twigs with berry juice. Building and decorating the bower is an essential aspect of his courtship behavior. Female satin bowerbirds preferentially mate with males who have the best built and decorated bowers.

Purchase any of our products at your local college store or at our preferred online store www.cengagebrain.com

Contents in Brief

INTRODUCTION

- 1 Invitation to Biology

UNIT I PRINCIPLES OF CELLULAR LIFE

- 2 Life's Chemical Basis
- 3 Molecules of Life
- 4 Cell Structure
- 5 Ground Rules of Metabolism
- 6 Where It Starts—Photosynthesis
- 7 Releasing Chemical Energy

UNIT II GENETICS

- 8 DNA Structure and Function
- 9 From DNA to Protein
- 10 Control of Gene Expression
- 11 How Cells Reproduce
- 12 Meiosis and Sexual Reproduction
- 13 Observing Patterns in Inherited Traits
- 14 Chromosomes and Human Inheritance
- 15 Studying and Manipulating Genomes

UNIT III PRINCIPLES OF EVOLUTION

- 16 Evidence of Evolution
- 17 Processes of Evolution
- 18 Organizing Information About Species
- 19 Life's Origin and Early Evolution

UNIT IV EVOLUTION AND BIODIVERSITY

- 20 Viruses, Bacteria, and Archaea
- 21 Protists—The Simplest Eukaryotes
- 22 The Land Plants
- 23 Fungi
- 24 Animal Evolution—The Invertebrates
- 25 Animal Evolution—The Vertebrates
- 26 Human Evolution

UNIT V HOW PLANTS WORK

- 27 Plant Tissues
- 28 Plant Nutrition and Transport
- 29 Life Cycles of Flowering Plants
- 30 Communication Strategies in Plants

UNIT VI HOW ANIMALS WORK

- 31 Animal Tissues and Organ Systems
- 32 Neural Control
- 33 Sensory Perception
- 34 Endocrine Control
- 35 Structural Support and Movement
- 36 Circulation
- 37 Immunity
- 38 Respiration
- 39 Digestion and Nutrition
- 40 Maintaining the Internal Environment
- 41 Animal Reproduction
- 42 Animal Development
- 43 Animal Behavior

UNIT VII PRINCIPLES OF ECOLOGY

- 44 Population Ecology
- 45 Community Ecology
- 46 Ecosystems
- 47 The Biosphere
- 48 Human Impacts on the Biosphere

Detailed Contents

INTRODUCTION

- 1 Invitation to Biology**
 - 1.1**  Secret Life of Earth 3, 19
 - 1.2** Life Is More Than the Sum of Its Parts 4
Life's Organization 4
 - 1.3** How Living Things Are Alike 6
Organisms Require Energy and Nutrients 6
Homeostasis 7
DNA Is Hereditary Material 7
 - 1.4** How Living Things Differ 8
 - 1.5** Organizing Information About Species 9
A Rose by Any Other Name . . . 9
Distinguishing Species 9
 - 1.6** The Science of Nature 11
Thinking About Thinking 11
The Scientific Method 11
Research in the Real World 12
 - 1.7** Analyzing Experimental Results 15
Sampling Error 15
Bias in Interpreting Results 16
 - 1.8** The Nature of Science 17
What Science Is 17
What Is Not Science 18
What Science Is Not 19

UNIT I PRINCIPLES OF CELLULAR LIFE

2 Life's Chemical Basis

- 2.1  Mercury Rising 23, 33
- 2.2 Building Blocks of Matter 24
 - Atoms and Elements 24
 - Isotopes and Radioisotopes 24
- 2.3 Why Electrons Matter 26
- 2.4 Chemical Bonds 27
- 2.5 Hydrogen Bonding and Water 30
 - Hydrogen Bonds 30
 - Water's Special Properties 30
- 2.6 Acids and Bases 31

3 Molecules of Life

- 3.1  Fear of Frying 37, 49
- 3.2 The Chemistry of Biology 38
 - The Carbon Backbone 38
 - Functional Groups 39
 - Modeling Organic Compounds 40
 - Metabolic Reactions 40
- 3.3 Carbohydrates 41
 - Simple Sugars 41
 - Oligosaccharides 42
 - Polysaccharides 42
- 3.4 Lipids 43
 - Lipids in Biological Systems 43
- 3.5 Proteins 46
 - From Structure to Function 46
 - The Importance of Protein Structure 48
- 3.6 Nucleic Acids 49

4 Cell Structure

- 4.1  Food for Thought 53, 71
- 4.2 What Is a Cell? 54
 - Components of All Cells 54
 - Visualizing Cells 55
 - Why Cells Are So Small 56
 - Properties of All Cells 57
- 4.3 Introducing the Prokaryotes 57
 - Structural Features 58
 - Biofilms 59
- 4.4 Introducing the Eukaryotic Cell 59
 - The Nucleus 60
- 4.5 The Endomembrane System 62
- 4.6 Mitochondria 64
- 4.7 Chloroplasts and Other Plastids 65
- 4.8 The Cytoskeleton 66
 - Cytoskeletal Elements 66
 - Cellular Movement 66

Detailed Contents (continued)

- 4.9 Cell Surface Specializations 68
 - Extracellular Matrices 68
 - Cell Junctions 69

- 4.10 The Nature of Life 70

5 Ground Rules of Metabolism

- 5.1  A Toast to Alcohol Dehydrogenase 77, 95

- 5.2 Energy in the World of Life 78

- 5.3 Energy in the Molecules of Life 80
 - Chemical Bond Energy 80
 - Why Earth Does Not Go Up in Flames 80
 - Energy In, Energy Out 81

- 5.4 How Enzymes Work 82
 - The Transition State 82
 - Environmental Influences 83

- 5.5 Metabolic Pathways 84
 - Controls Over Metabolism 84
 - Electron Transfers 85

- 5.6 Cofactors 86
 - ATP: A Special Coenzyme 87

- 5.7 A Closer Look at Cell Membranes 88
 - The Fluid Mosaic Model 88
 - Proteins Add Function 89

- 5.8 Diffusion Across Membranes 90
 - Factors That Affect Diffusion 90
 - Osmosis 90
 - Turgor 91

- 5.9 Membrane Transport Mechanisms 92
 - Passive Transport 92
 - Active Transport 93

- 5.10 Membrane Trafficking 94
 - Recycling Membrane 95

6 Where It Starts—Photosynthesis

- 6.1  Biofuels 99, 111

- 6.2 Overview of Photosynthesis 100
 - Two Stages of Reactions 101

- 6.3 Sunlight as an Energy Source 102
 - To Catch a Rainbow 103

- 6.4 The Light-Dependent Reactions 104
 - The Cyclic Pathway 105
 - The Noncyclic Pathway 106
 - Evolution of the Two Pathways 106

- 6.5 The Light-Independent Reactions 108
 - The Calvin–Benson Cycle 108
 - Photorespiration 108
 - Alternative Pathways in Plants 109

7 Releasing Chemical Energy

- 7.1  Risky Business 115, 127

- 7.2 Introduction to Carbohydrate Breakdown Pathways 116
 - Reaction Pathways 117
 - Glycolysis: Sugar Breakdown Begins 118
 - Comparing Other Pathways 119

- 7.3** Aerobic Respiration Continues 119
 - Acetyl–CoA Formation 120
 - The Citric Acid Cycle 120
- 7.4** Aerobic Respiration Ends 121
- 7.5** Fermentation 123
- 7.6** Alternative Energy Sources in Food 125

UNIT II GENETICS

8 DNA Structure and Function

- 8.1**  A Hero Dog's Golden Clones 131, 143
- 8.2** Discovery of DNA's Function 132
- 8.3** Discovery of DNA's Structure 134
 - Building Blocks of DNA 134
 - Fame and Glory 134
 - The Anatomy of DNA 136
- 8.4** Eukaryotic Chromosomes 137
 - Chromosome Number and Type 138
- 8.5** DNA Replication 138
 - Semiconservative Replication 139
 - Directional Synthesis 140
- 8.6** Mutations: Cause and Effect 140
- 8.7** Cloning Adult Animals 142

9 From DNA to Protein

- 9.1**  Ricin, RIP 147, 157
- 9.2** DNA, RNA, and Gene Expression 148
- 9.3** Transcription: DNA to RNA 150
 - Post-Transcriptional Modifications 151
- 9.4** RNA and the Genetic Code 152
 - rRNA and tRNA 153

Detailed Contents **(continued)**

- 9.5 Translation: RNA to Protein 154
- 9.6 Consequences of Mutations 155

10 Control of Gene Expression

- 10.1  Between You and Eternity 161, 171
- 10.2 Regulating Gene Expression 162
 - Switching Genes On and Off 162
- 10.3 Regulating Gene Expression in Development 164
 - How Genes Direct Embryonic Development 164
 - Examples of Developmental Outcomes 166
- 10.4 Regulating Gene Expression to Adjust Metabolism 168
 - Circadian Rhythms 168
 - Lactose Metabolism in Bacteria 168
 - Lactose Metabolism in Humans 169
- 10.5 Epigenetics 170

11 How Cells Reproduce

- 11.1  Henrietta's Immortal Cells 175, 183
- 11.2 Multiplication by Division 176
 - Mitosis Maintains the Chromosome Number 177
 - Controlling the Cell Cycle 177
 - Why Cells Divide by Mitosis 177
- 11.3 A Closer Look at Mitosis 179
- 11.4 Cytoplasmic Division 180
- 11.5 Marking Time with Telomeres 181
- 11.6 When Mitosis Is Dangerous 182

12 Meiosis and Sexual Reproduction

- 12.1  Why Sex? 187, 195
- 12.2 Meiosis in Sexual Reproduction 188
 - Introducing Alleles 188
 - Meiosis Halves the Chromosome Number 188
 - Fertilization Restores the Chromosome Number 189
- 12.3 Visual Tour of Meiosis 190
- 12.4 Meiosis Fosters Genetic Diversity 192
 - Crossing Over 192
 - Chromosome Segregation 192
- 12.5 An Ancestral Connection 194

13 Observing Patterns in Inherited Traits

- 13.1  Menacing Mucus 199, 211
- 13.2 Mendel, Pea Plants, and Inheritance Patterns 200
 - Mendel's Experiments 200
 - Inheritance in Modern Terms 201
- 13.3 Mendel's Law of Segregation 202
- 13.4 Mendel's Law of Independent Assortment 204
 - The Contribution of Crossovers 205
- 13.5 Non-Mendelian Inheritance 206
 - Codominance 206
 - Incomplete Dominance 206
 - Polygenic Inheritance 207
 - Pleiotropy 207

13.6 Nature and Nurture 208
Examples of Environmental Effects 208

13.7 Complex Variation in Traits 209
Continuous Variation 210

14 Chromosomes and Human Inheritance

14.1 📍 Shades of Skin 215, 227

14.2 Human Chromosomes 216
Studying Human Genetics 216

14.3 Autosomal Inheritance 218
The Autosomal Dominant Pattern 218
The Autosomal Recessive Pattern 219

14.4 X-Linked Inheritance 220

14.5 Changes in Chromosome Structure 222
Types of Chromosomal Change 222
Chromosome Changes in Evolution 223

14.6 Changes in Chromosome Number 224
Down Syndrome 224
Sex Chromosome Aneuploidy 225

14.7 Genetic Screening 226

15 Studying and Manipulating Genomes

15.1 📍 Personal Genetic Testing 231, 245

15.2 DNA Cloning 232
Why Clone DNA? 233

15.3 Isolating Genes 234
DNA Libraries 234
PCR 235

15.4 DNA Sequencing 236
The Human Genome Project 236

15.5 Genomics 238
DNA Profiling 238

15.6 Genetic Engineering 240
Genetically Modified Organisms 240
Safety Issues 240

15.7 Designer Plants 241

15.8 Biotech Barnyards 242

15.9 Editing Genomes 243
CRISPR 244

Detailed Contents (continued)

UNIT III PRINCIPLES OF EVOLUTION

16 Evidence of Evolution

- 16.1  Reflections of a Distant Past 249, 263
- 16.2 Old Beliefs and New Discoveries 250
- 16.3 Evolution by Natural Selection 252
- 16.4 Fossils: Evidence of Ancient Life 255
 - The Fossil Record 256
 - Missing Links in the Fossil Record 256
- 16.5 Changes in the History of Earth 258
 - Plate Tectonics 258
 - The Geologic Time Scale 259
 - Radiometric Dating 262

17 Processes of Evolution

- 17.1  Superbug Farms 267, 287
- 17.2 Alleles in Populations 268
 - Variation in Shared Traits 268
 - An Evolutionary View of Mutations 268
 - Allele Frequency 269
- 17.3 Genetic Equilibrium 270
- 17.4 Patterns of Natural Selection 272
 - Directional Selection 272
 - Stabilizing Selection 274
 - Disruptive Selection 275
- 17.5 Natural Selection and Diversity 276
 - Survival of the Sexiest 276

- Maintaining Multiple Alleles 277
- 17.6 Nonselective Evolution 278
 - Factors That Reduce Genetic Diversity 278
 - Gene Flow 279
- 17.7 Reproductive Isolation 280
- 17.8 Models of Speciation 282
 - Allopatric Speciation 282
 - Sympatric Speciation 283
 - Parapatric Speciation 285
- 17.9 Macroevolution 285
 - Evolutionary Theory 287

18 Organizing Information About Species

- 18.1  Bye Bye Birdie 291, 299
- 18.2 Phylogeny 292
- 18.3 Comparing Form and Function 293
 - Divergent Evolution 293
 - Convergent Evolution 294
- 18.4 Comparing Molecules 295
 - DNA and Protein Sequence Comparisons 296
- 18.5 Comparing Development 297
- 18.6 Phylogeny Research 298

19 Life's Origin and Early Evolution

- 19.1  Looking for Life 303, 313
- 19.2 The Early Earth 304
 - Origin of the Universe and Earth 304
 - Conditions on the Early Earth 304
- 19.3 Organic Monomers Form 305
 - Organic Molecules from Inorganic Precursors 305
 - Sources of Life's First Building Blocks 305
- 19.4 From Polymers to Protocells 306
 - Properties of Cells 306
 - Origin of Metabolism 306
 - Origin of the Genome 307
 - Origin of the Plasma Membrane 307
- 19.5 The Age of Prokaryotes 308
 - The Last Common Ancestor of All Life 308
 - Fossil Evidence of Early Life 308
 - Fossils of Early Cells 309
- 19.6 A Rise in Oxygen 310
 - The Cause of Oxygenation 310
 - Effects of Oxygenation 310
- 19.7 Origin and Evolution of Eukaryotes 310
 - Eukaryotic Traits and Traces 310
 - A Mixed Heritage 311
 - Origin of the Nucleus 311
 - The Endosymbiont Hypothesis 311
 - Diversification of Eukaryotes 313

UNIT IV EVOLUTION AND BIODIVERSITY

20 Viruses, Bacteria, and Archaea

- 20.1  The Human Microbiota 317, 333
- 20.2 Virus Structure and Function 318
- 20.3 Viral Replication 319
 - Steps in Viral Replication 319
 - Bacteriophage Replication 320
 - Replication of HIV 320
- 20.4 Viruses and Human Health 321
 - The Threat of Infectious Disease 321
 - Common Viral Diseases 321
 - Emerging Viral Diseases 322
 - Viral Mutation and Reassortment 322
- 20.5 Prokaryotic Structure and Function 324

Detailed Contents (continued)

Structural Traits 324
Reproduction 325
Gene Transfers 325

20.6 Metabolic Diversity in Prokaryotes 326

Diverse Modes of Nutrition 326
Aerobes and Anaerobes 327
Nitrogen Fixation 327
Dormant Resting Structures 327

20.7 Major Bacterial Lineages 328

Gram-Positive Bacteria 328
Cyanobacteria 328
Proteobacteria 328
Spirochetes and Chlamydias 329

20.8 Bacteria as Pathogens 330

Bacterial Toxins 330
Antibiotics 330
Antibiotic Resistance 331

20.9 Archaea 331

Discovery of the Third Domain 331
Here, There, Everywhere 332

21 Protists—The Simplest Eukaryotes

21.1 📍 Malaria: A Protistan Disease 337, 351

21.2 A Diverse Collection of Lineages 338

Classification and Phylogeny 338
Level of Organization 338
Cell Structure 339
Metabolic Diversity 340
Habitats 340
Life Cycles 340

21.3 Excavates 340

Metamonads 340
Euglenozoans 341

21.4 Stramenopiles 342

Diatoms 342
Brown Algae 343
Water Molds 343

21.5 Alveolates 344

Ciliates 344
Dinoflagellates 345
Apicomplexans 345

21.6 Rhizarians 347

21.7 Archaeplastids 348

Red Algae 348
Green Algae 349

21.8 Amoebozoans and Opisthokonts 350

Opisthokonts 350

22 The Land Plants

22.1 📍 Saving Seeds 355, 371

22.2 Plant Ancestry and Diversity 356

From Algal Ancestors to Embryophytes 356
An Adaptive Radiation on Land 356

22.3 Evolutionary Trends Among Plants 358

From Haploid to Diploid Dominance 358
Structural Adaptations 358
Pollen and Seeds 359

22.4 Bryophytes 359

Mosses 360
Liverworts 361
Hornworts 362

22.5 Seedless Vascular Plants 362

Ferns 362
Whisk Ferns and Horsetails 363
Club Mosses 363

- 22.6** History of the Vascular Plants 364
From Tiny Branches to Coal Forests 364
Rise of the Seed Plants 365
- 22.7** Gymnosperms 366
Gymnosperm Diversity 366
Gymnosperm Life Cycle 367
- 22.8** Angiosperm Traits 368
The Angiosperm Life Cycle 369
- 22.9** Angiosperm Diversity 369
Factors Contributing to Angiosperm Success 369
Angiosperm Lineages 370
Ecological and Economic Importance 370

23 Fungi

- 23.1** High-Flying Fungi 375, 385
- 23.2** Fungal Traits and Diversity 376
Fungus Structure 376
Fungus Life Cycles 377
- 23.3** Flagellated Fungi 378
- 23.4** Zygote Fungi and Relatives 378
Zygote Fungi 378
Microsporidia—Intracellular Parasites 379
Glomeromycetes 379
- 23.5** Sac Fungi 380
Sac Fungal Yeasts 380
Multicelled Sac Fungi 380
- 23.6** Club Fungi 381

Life Cycle 381
Club Fungus Diversity 381

- 23.7** Biological Roles of Fungi 382
Nature's Recyclers 382
Fungal Partnerships 382
Parasites and Pathogens 383
Human Uses of Fungi 384

24 Animal Evolution—The Invertebrates

- 24.1** Medicines from the Sea 389, 411
- 24.2** Animal Traits and Body Plans 390
What Is an Animal? 390
Variation in Animal Body Plans 390
- 24.3** Animal Origins and Diversification 392
Colonial Origins 392
Early Animals 392
The Cambrian Explosion 392
- 24.4** Sponges 393
- 24.5** Cnidarians 394
Body Plans 394
Diversity and Life Cycles 394
- 24.6** Flatworms 396
Flatworm Traits 396
Free-Living Flatworms 396
Parasitic Flatworms 397
- 24.7** Annelids 398
Polychaetes 398
Leeches 398
Oligochaetes 399
- 24.8** Mollusks 400
Mollusk Diversity 400
- 24.9** Roundworms 402
- 24.10** Arthropods 403
Key Arthropod Adaptations 403
Arthropod Diversity 404
Insect Traits and Diversity 407
Importance of Insects 408

Detailed Contents (continued)

- 24.11** The Spiny-Skinned Echinoderms 409
 - The Protostome–Deuterostome Split 409
 - Echinoderm Characteristics and Body Plan 410
 - Echinoderm Diversity 410

25 Animal Evolution—The Vertebrates

- 25.1** 📍 Very Early Birds 415, 431
- 25.2** Chordate Traits and Evolutionary Trends 416
 - Chordate Characteristics 416
 - Invertebrate Chordates 416
 - Overview of Chordate Evolution 416
- 25.3** Fishes 418
 - Jawless Fishes 418
 - Evolution of Jawed Fishes 418
 - Jawed Fishes 420
- 25.4** Amphibians 422
 - Adapting to Life on Land 422
 - Modern Amphibians 422
 - Declining Diversity 423
- 25.5** Amniote Evolution 424
- 25.6** Reptiles 425
 - Lizards and Snakes 425
 - Turtles 425
 - Crocodylians 425
- 25.7** Birds 426
 - Adaptations to Flight 426
 - Reproduction and Development 427
 - Avian Diversity 427

- 25.8** Mammals 428
 - Mammalian Origins and Diversification 428
 - Monotremes—Egg-Laying Mammals 429
 - Marsupials—Pouched Mammals 430
 - Placental Mammals 430

26 Human Evolution

- 26.1** 📍 A Bit of a Neanderthal 435, 445
- 26.2** Primates: Our Order 436
 - Primate Characteristics 436
 - Origins and Lineages 437
- 26.3** Hominoids 438
 - Hominoid Origins and Divergences 438
 - Modern Apes 438
 - A Human–Great Ape Comparison 439
- 26.4** Early Hominins 440
 - Australopiths 440
 - Factors Favoring Bipedalism 441
- 26.5** Early Humans 441
 - Classifying Fossils—Lumpers and Splitters 441
 - Homo habilis* 442
 - Homo erectus* 442
 - Early Culture 442
- 26.6** Recent Human Lineages 443
 - Neanderthals 443
 - Denisovans 443
 - Flores Hominins 443
 - Homo naledi* 444
 - Homo sapiens* 444
 - The Leaky Replacement Model 445

UNIT V HOW PLANTS WORK

27 Plant Tissues

- 27.1** 📍 Sequestering Carbon in Forests 449, 463
- 27.2** The Plant Body 450
- 27.3** Plant Tissues 451
 - Simple Tissues 452
 - Complex Tissues 452

- 27.4** Stems 453
 - Internal Structure 453
 - Stem Specializations 454
- 27.5** Leaves 455
- 27.6** Roots 457
 - External Structure 457
 - Internal Structure 458
- 27.7** Patterns of Growth 458
 - Primary Growth 458
 - Secondary Growth 460

28 Plant Nutrition and Transport

- 28.1** 📍 Leafy Cleanup 467, 477
- 28.2** Plant Nutrients 468
 - Properties of Soil 468
 - How Soils Change 469
- 28.3** Root Adaptations for Nutrient Uptake 470
 - The Function of Endodermis 470
 - Beneficial Microorganisms 471
- 28.4** Movement of Water in Plants 472
 - Cohesion–Tension Theory 473
 - Water-Conserving Adaptations 474
- 28.5** Movement of Organic Compounds in Plants 475
 - Pressure Flow Theory 476

29 Life Cycles of Flowering Plants

- 29.1** 📍 Plight of the Honeybee 481, 495

- 29.2** Floral Structure and Function 482
 - Pollination 483
- 29.3** A New Generation Begins 486
- 29.4** Flower Sex 488
- 29.5** Seed Formation 489
- 29.6** Fruits 490
- 29.7** Early Development 492
 - Breaking Dormancy 492
 - After Germination 492
- 29.8** Asexual Reproduction of Flowering Plants 494
 - Agricultural Applications 494

30 Communication Strategies in Plants

- 30.1** 📍 Prescription: Chocolate 499, 513
- 30.2** Chemical Signaling in Plants 500
- 30.3** Auxin and Cytokinin 501
 - Auxin 501
 - Cytokinin 502
- 30.4** Gibberellin 503
- 30.5** Abscisic Acid and Ethylene 505
 - Abscisic Acid 505
 - Ethylene 506
- 30.6** Movement 507
 - Environmental Triggers 507
- 30.7** Responses to Recurring Environmental Change 509
 - Daily Change 509
 - Seasonal Change 509

Detailed Contents (continued)

- 30.8 Responses to Stress 511**
 - Defenses Against Disease 511
 - Defenses Against Herbivory 512

UNIT VI HOW ANIMALS WORK

31 Animal Tissues and Organ Systems

- 31.1**  Making Replacement Cells 517, 531
- 31.2** Animal Body Plans 518
 - Levels of Organization 518
 - Body Fluids 518
 - Evolution of Animal Body Plans 518
- 31.3** Epithelial Tissue 520
 - Types of Epithelia 520
 - Carcinomas—Epithelial Cell Cancers 521
- 31.4** Connective Tissues 521
 - Loose and Dense Connective Tissues 522
 - Specialized Connective Tissues 522
- 31.5** Muscle Tissue 524
- 31.6** Nervous Tissue 525
- 31.7** Organ Systems 526
- 31.8** Human Skin 528
 - Structure of Skin 528
 - Sunlight and the Skin 529
- 31.9** Maintaining Homeostasis Through Negative Feedback 530

32 Neural Control

- 32.1**  Impacts of Concussions 535, 555
- 32.2** Animal Nervous Systems 536
 - Invertebrate Nervous Systems 536
 - The Vertebrate Nervous System 537
- 32.3** Cells of the Nervous System 538
 - Three Types of Neurons 538
 - Glial Cells 538
- 32.4** Electrical Signaling in Neurons 539
 - Resting Potential 539
 - The Action Potential 539
- 32.5** Chemical Signalling by Neurons 542
 - The Synapse 542
 - Synaptic Integration 543
- 32.6** Neurotransmitter Function 543
 - Discovery of Neurotransmitters 543
 - Receptor Diversity 544
 - Neurotransmitter Diversity 544
 - Effects of Psychoactive Drugs 544
- 32.7** The Peripheral Nervous System 546
 - Somatic Nervous System 546
 - Autonomic Nervous System 546
- 32.8** Cells and Tissues of the Central Nervous System 548
 - Meninges and the Cerebrospinal Fluid 548
 - Gray Matter and White Matter 548
 - Glia of the Central Nervous System 548
- 32.9** The Spinal Cord 549
 - Structure of the Spinal Cord 549
 - Interrupted Spinal Signaling 550

- 32.10** The Vertebrate Brain 550
 - The Vertebrate Brain 550
 - Functional Anatomy of the Human Brain 550
- 32.11** The Human Cerebral Cortex 552
- 32.12** Emotion and Memory 553
 - The Emotional Brain 553
 - Making Memories 553
- 32.13** Studying Brain Function 554
 - Observing Electrical Activity 554
 - Monitoring Metabolism 554
 - Examining Brain Tissue 555

33 Sensory Perception

- 33.1**  Neuroprostheses 559, 575
- 33.2** Overview of Sensory Pathways 560
 - Sensory Diversity 560
 - From Sensing to Sensation to Perception 561
- 33.3** General Senses 562
 - The Somatosensory Cortex 562
 - Pain 563
- 33.4** Chemical Senses 564
 - Sense of Smell 564
 - Sense of Taste 565
 - Pheromones—Chemical Messages 565
- 33.5** Hearing 566
 - Properties of Sound 566
 - The Vertebrate Ear 566
 - Range of Hearing 568
- 33.6** Balance and Equilibrium 569
 - Dynamic Equilibrium 569
 - Static Equilibrium 569
- 33.7** Vision 570
 - Invertebrate Eyes 570
 - Vertebrate Eyes 571
- 33.8** Human Vision 571
 - Anatomy of the Human Eye 571
 - Focusing Mechanisms 573
 - The Photoreceptors 574
 - Signal Transduction to Visual Processing 574

34 Endocrine Control

- 34.1**  Endocrine Disruptors 579, 593
- 34.2** The Vertebrate Endocrine System 580
 - Signals That Travel in the Blood 580
 - Discovery of Hormones 580
- 34.3** The Nature of Hormone Action 582
 - Hormones Derived from Amino Acids 582
 - Steroid Hormones 582
 - Hormone Receptors 582
- 34.4** The Hypothalamus and Pituitary Gland 584
 - Posterior Pituitary Function 584
 - Anterior Pituitary Function 585
 - Hormonal Growth Disorders 585
- 34.5** The Pineal Gland 586
- 34.6** Thyroid and Parathyroid Glands 586
 - Feedback Control of Thyroid Hormone 586
 - Thyroid Disorders and Disruptors 587
 - Hormonal Control of Blood Calcium 587
- 34.7** Pancreatic Hormones 588
 - Regulation of Blood Sugar 588
 - Diabetes 588
- 34.8** The Adrenal Glands 590
 - The Adrenal Cortex 590
 - The Adrenal Medulla 590
 - Stress, Elevated Cortisol, and Health 591
 - Cortisol Deficiency 591
- 34.9** The Gonads 591
- 34.10** Invertebrate Hormones 592

Detailed Contents **(continued)**

35 Structural Support and Movement

- 35.1**  Bulking Up 597, 611
- 35.2** Animal Movement 598
 - Locomotion in Water 598
 - Locomotion on Land 598
 - Flight 598
- 35.3** Types of Skeletons 600
 - Invertebrate Skeletons 600
 - The Vertebrate Endoskeleton 600
- 35.4** Bone Structure and Function 602
 - Bone Anatomy 602
 - Bone Development, Remodeling, and Repair 602
- 35.5** Joint Structure and Function 604
- 35.6** Skeletal Muscle Function 605
- 35.7** How Muscle Contracts 606
 - Structure of Skeletal Muscle 606
 - The Sliding-Filament Model 606
- 35.8** Nervous Control of Muscle Contraction 608
 - Initiating Muscle Contraction 608
 - Motor Units and Muscle Tension 609
 - Disrupted Control of Skeletal Muscle 609
- 35.9** Muscle Metabolism 609
 - Energy-Releasing Pathways 609
 - Types of Muscle Fibers 610
 - Effects of Exercise and Inactivity 610

36 Circulation

- 36.1**  A Shocking Save 615, 631
- 36.2** Circulatory Systems 616
 - Open and Closed Circulatory Systems 616
 - Evolution of Vertebrate Circulation 616
- 36.3** Human Cardiovascular System 618
 - The Pulmonary Circuit 618
 - The Systemic Circuit 618
- 36.4** The Human Heart 620
 - The Cardiac Cycle 620
 - Setting the Pace for Contraction 621
- 36.5** Vertebrate Blood 622
 - Plasma 622
 - Cellular Components 622

- 36.6** Arteries and Arterioles 624
 - Rapid Transport in Arteries 624
 - Adjusting Flow at Arterioles 624
- 36.7** Blood Pressure 625
- 36.8** Exchanges at Capillaries 626
 - Slow Flow in Capillaries 626
 - Mechanisms of Capillary Exchange 626
- 36.9** Back to the Heart 627
- 36.10** Blood and Cardiovascular Disorders 627
 - Altered Blood Cell Count 627
 - Cardiovascular Disorders 628
- 36.11** Interactions with the Lymphatic System 630
 - Lymph Vascular System 630
 - Lymphoid Organs and Tissues 631

37 Immunity

- 37.1**  Community Immunity 635, 657
- 37.2** Integrated Responses to Threats 636
 - Three Lines of Defense 636
 - The Defenders 637
- 37.3** Surface Barriers 638
 - Biological Barriers 638
 - Physiological and Anatomical Barriers 639
- 37.4** Mechanisms of Innate Immunity 640
 - Complement 640
 - Phagocytosis 641
 - Inflammation 642
 - Fever 642

- 37.5** Antigen Receptors 643
 - Antigen Receptor Diversity 645
- 37.6** Overview of Adaptive Immunity 645
 - Two Arms of Adaptive Immunity 645
 - Antigen Processing 646
- 37.7** Adaptive Immunity I: An Antibody-Mediated Response 648
 - Immunization 649
 - Antibodies in ABO Blood Typing 650
- 37.8** Adaptive Immunity II: The Cell-Mediated Response 650
 - Cytotoxic T Cells: Activation and Action 650
 - The Role of Natural Killer (NK) Cells 652
- 37.9** When Immunity Goes Wrong 652
 - Overly Vigorous Responses 652
 - Immune Evasion 654
 - Immune Deficiency 654
 - AIDS 654

38 Respiration

- 38.1**  Carbon Monoxide—A Stealthy Poison 661, 675
- 38.2** The Nature of Respiration 662
 - Sites of Gas Exchange 662
 - Factors Affecting Gas Exchange 662
 - Respiratory Medium—Air or Water? 662
- 38.3** Invertebrate Respiration 663
 - Gilled Invertebrates 664
 - Air-Breathing Invertebrates 664
- 38.4** Vertebrate Respiration 665
 - Respiration in Fishes 665
 - Paired Lungs of Tetrapods 665
- 38.5** Human Respiratory System 666
 - The Respiratory Tract 667
 - The Lungs 668
 - Pulmonary Blood Vessels 668
 - Muscles of Respiration 668
- 38.6** How We Breathe 668
 - The Respiratory Cycle 668
 - Respiratory Volumes 669
 - Control of Breathing 669
 - Choking—A Blocked Airway 670

Detailed Contents (continued)

- 38.7** Gas Exchange and Transport 670
 - The Respiratory Membrane 670
 - Oxygen Transport 670
 - Carbon Dioxide Transport 672
- 38.8** Respiratory Adaptations 672
 - High Climbers 672
 - Deep Divers 673
- 38.9** Respiratory Diseases and Disorders 674
 - Interrupted Breathing 674
 - Lung Diseases and Disorders 674
 - Smoking and Vaping 674

39 Digestion and Nutrition

- 39.1**  Breaking It Down 679, 695
- 39.2** Animal Digestive Systems 680
 - Intracellular Digestion in Sponges 680
 - Extracellular Digestion 680
 - Sac or Tube? 680
 - Regional Specializations 681
- 39.3** Human Digestive Tract 682
- 39.4** Chewing and Swallowing 683
- 39.5** The Stomach 684
 - Stomach Structure 684
 - Components and Function of Gastric Fluid 685
 - Gastric Hormones 685
 - Stomach Ulcers and Reflux 685

- 39.6** The Small Intestine 686
 - An Enormous Surface Area 686
 - Interactions with Accessory Organs 686
 - Hormones of the Small Intestine 687
 - Digestion and Absorption 688
- 39.7** The Large Intestine 689
 - Concentrating and Expelling Waste 689
 - Beneficial Microbes 689
- 39.8** Nutritional Requirements 690
 - Macronutrients 690
 - Vitamins 692
 - Minerals 693
- 39.9** Maintaining a Healthy Weight 694
 - What Is a Healthy Weight? 694
 - Why Is Obesity Unhealthy? 694
 - Causes of Obesity 695

40 Maintaining the Internal Environment

- 40.1**  Urine Tests 699, 711
- 40.2** Fluid Volume and Composition 700
 - Water Gains and Losses 700
 - Metabolic Wastes 700
- 40.3** Excretory Organs 700
 - Planarian Protonephridia 701
 - Earthworm Nephridia 701
 - Arthropod Malpighian Tubules 701
 - Vertebrate Kidneys 701
- 40.4** The Human Urinary System 702
 - Organs of the Urinary System 702
 - Tubular Structure of the Kidneys 702
 - Blood Vessels of the Kidneys 703
- 40.5** How Urine Forms 704
 - Glomerular Filtration 704
 - Tubular Reabsorption 704
 - Tubular Secretion 705
 - Concentrating the Filtrate 705
- 40.6** Regulating Solute Levels 705
 - Fluid Volume and Tonicity 705
 - Acid–Base Balance 707
- 40.7** Impaired Kidney Function 707

- 40.8 Excretory Adaptations 708**
 Fluid Regulation in Bony Fishes 708
 Kangaroo Rats and Water Scarcity 709
- 40.9 Heat Gains and Losses 709**
 How the Core Temperature Can Change 709
 Modes of Thermoregulation 710
- 40.10 Responses to Cold and Heat 710**
 Responses to Cold 710
 Responses to Heat 711
-
- 41 Animal Reproduction**
- 41.1**  Assisted Reproduction 715, 731
- 41.2 Modes of Animal Reproduction 716**
 Asexual Versus Sexual Reproduction 716
 Variations on Sexual Reproduction 717
- 41.3 Organs of Sexual Reproduction 718**
 Gonads, Ducts, and Glands 718
 How Gametes Form 718
- 41.4 Sex Organs of Human Females 720**
 Ovaries—Female Gonads 720
 Reproductive Ducts and Accessory Glands 720
- 41.5 Female Reproductive Cycles 721**
 Human Ovarian Cycle 721
 Human Menstrual Cycle 722
 Hormonal Control of Monthly Cycles 722
 Animal Estrous Cycles 722

- 41.6 Sex Organs of Human Males 724**
 Testes—Male Gonads 724
 Reproductive Ducts and Accessory Glands 724
 Germ Cells to Sperm Cells 725
- 41.7 Bringing Gametes Together 726**
 Copulation 726
 The Sperm's Journey 726
 Fertilization 726
- 41.8 Contraception and Infertility 728**
 Birth Control Options 728
 Infertility 729
- 41.9 Sexually Transmitted Diseases 730**
 Trichomoniasis 730
 Bacterial STDs 730
 Viral STDs 730

42 Animal Development

- 42.1**  Prenatal Problems 735, 750
- 42.2 Stages of Animal Development 736**
 A General Model for Animal Development 736
- 42.3 From Zygote to Gastrula 738**
 Components of Eggs and Sperm 738
 Cleavage—Onset of Multicellularity 738
 Gastrulation 739
- 42.4 Tissue and Organ Formation 739**
 Cell Differentiation 740
 Embryonic Induction 740
 Apoptosis 740
 Cell Migrations 741

Detailed Contents **(continued)**

- 42.5** Evolutionary Developmental Biology 742
 - Constraints on Body Plans 742
 - Developmental Mutations 742
- 42.6** Overview of Human Development 743
- 42.7** Early Human Development 744
 - Cleavage and Blastocyst Formation 744
 - Implantation and Formation of the Extra-Embryonic Membranes 744
 - Gastrulation and Onset of Organ Formation 745
- 42.8** Emergence of Distinctly Human Features 746
- 42.9** Structure and Function of the Placenta 748
- 42.10** Labor, Birth, and Lactation 749
 - Vaginal Birth 749
 - Surgical Delivery 749
 - Milk Production and Components 749

43 Animal Behavior

- 43.1**  Can You Hear Me Now? 755, 767
- 43.2** Factors Affecting Behavior 756
 - Genetic Variation Within a Species 756
 - Genetic Differences Between Species 756
 - Environmental Effects 757
- 43.3** Instinct and Learning 758
 - Instinctive Behavior 758
 - Time-Sensitive Learning 758
 - Conditioned Responses 758
 - Other Types of Learned Behavior 759

- 43.4** Movements and Navigation 760
 - Taxis and Kinesis 760
 - Migration 760
- 43.5** Communication Signals 761
 - Evolution of Animal Communication 761
 - Types of Signals 761
 - Eavesdroppers and Counterfeiters 762
- 43.6** Mating and Parental Behavior 763
 - Mating Systems 763
 - Female Choice and Male-Male Competition 763
 - Parental Care 764
- 43.7** Group Living 764
 - Benefits of Grouping 764
 - Costs of Grouping 765
- 43.8** Altruism and Eusociality 766
 - Evolution of Altruism 766
 - Eusocial Animals 766

UNIT VII PRINCIPLES OF ECOLOGY

44 Population Ecology

- 44.1**  Managing Canada Geese 771, 785
- 44.2** Population Demographics 772
 - Population Size 772
 - Population Density and Distribution 773
 - Age Structure 774
 - Effects of Scale and Timing 774
 - Using Demographic Data 774

44.3 Modeling Population Growth 774
 Zero to Exponential Growth 774
 Biotic Potential 775

44.4 Limits on Population Growth 776
 Density-Dependent Limiting Factors 776
 Logistic Growth 776
 Density-Independent Factors 777

44.5 Life History Patterns 778
 Quantifying Life History Traits 778
 Environmental Effects on Life History 779

44.6 Predation Effects on Life History 780
 An Experimental Study 780
 Effects of Humans as Predators 781

44.7 Human Population Growth 782
 Expansions and Innovations 782
 Fertility and Age Structure 783
 Demographic Transitions 784
 Resource Consumption 784

45 **Community Ecology**

45.1 📍 Fighting Foreign Fire Ants 789, 803

45.2 What Factors Shape Community Structure? 790

45.3 Mutualism 791

45.4 Competitive Interactions 792
 Effects of Competition 792
 Resource Partitioning 793

45.5 Predator–Prey Interactions 794
 Functional Response to Prey Abundance 794
 Cyclic Changes in Abundance 794

45.6 Evolutionary Arms Races 795
 Predator–Prey Evolutionary Arms Race 795
 Coevolution of Herbivores and Plants 796

45.7 Parasites and Parasitoids 796
 Parasitism 796
 Brood Parasites—Strangers in the Nest 797
 Parasitoids 797
 Biological Pest Controls 797

45.8 How Communities Change 798
 Ecological Succession 798
 Effects of Disturbance 799
 The Role of Keystone Species 800
 Species Introductions 800

45.9 Biogeographic Patterns in Community Structure 802
 Latitudinal Patterns 802
 Island Patterns 802

46 **Ecosystems**

46.1 📍 Too Much of a Good Thing 807, 823

46.2 The Nature of Ecosystems 808
 Overview of the Participants 808
 Trophic Structure of Ecosystems 808

46.3 The Nature of Food Webs 810
 How Many Transfers? 811

46.4 Measuring Ecosystem Properties 811
 Primary Production 811
 Ecological Pyramids 812
 Ecological Efficiency 812

46.5 Biogeochemical Cycles 814
 A Biogeochemical Cycle 814

46.6 The Water Cycle 814
 Reservoirs and Transfers 814
 Limited Freshwater 815

Detailed Contents **(continued)**

- 46.7** The Carbon Cycle 816
 - Terrestrial Carbon Cycle 816
 - Marine Carbon Cycle 817
 - Carbon in Fossil Fuels 817
- 46.8** Greenhouse Gases and Climate Change 817
 - The Greenhouse Effect 817
 - Increasing Atmospheric Carbon Dioxide 818
 - Causes of the Atmospheric Increase in CO₂ 818
 - Changing Climate 819
- 46.9** Nitrogen Cycle 820
 - Reactions That Drive the Nitrogen Cycle 821
 - Human Effects on the Nitrogen Cycle 822
- 46.10** The Phosphorus Cycle 822

47 The Biosphere

- 47.1**  Going with the Flow 827, 847
- 47.2** Global Air Circulation Patterns 828
 - Seasonal Effects 828
 - Air Circulation and Rainfall 828
 - Surface Wind Patterns 829
- 47.3** Oceans, Landforms, and Climate 830
 - Ocean Currents 830
 - Proximity to the Ocean 830
 - Effects of Land Features 831
- 47.4** The El Niño Southern Oscillation 832
 - Widespread Effects 832
 - Effects on Human Health 833
 - Monitoring and Predicting 833

- 47.5** Biomes 834
 - Differences Between Biomes 834
 - Similarities Within a Biome 834
- 47.6** Deserts 836
 - Desert Locations and Conditions 836
 - Adaptations to Desert Life 836
 - The Crust Community 836
- 47.7** Grasslands and Dry Shrublands 837
 - Grasslands 837
 - Tropical Savannas 838
 - Dry Shrublands 838
- 47.8** Broadleaf Forests 838
 - Temperate Deciduous Forests 838
 - Tropical Rain Forests 839
- 47.9** Coniferous Forests 840
- 47.10** Tundra 841
 - Arctic Tundra 841
 - Alpine Tundra 841
- 47.11** Freshwater Ecosystems 842
 - Lakes 842
 - Streams and Rivers 843
 - Dissolved Oxygen Content 843
- 47.12** Coastal Ecosystems 844
 - Estuaries—Freshwater and Saltwater Mix 844
 - Rocky and Sandy Coasts 844
- 47.13** Coral Reefs 845

- 47.14** The Open Ocean 846
Pelagic Ecosystems 846
The Seafloor 846

48 Human Impacts on the Biosphere

- 48.1** 📍 Life in the Anthropocene 851, 863
- 48.2** The Extinction Crisis 852
Mass Extinction 852
The Sixth Great Mass Extinction 852
Causes of Declining Biodiversity 853
- 48.3** Harmful Land Use Practices 854
Desertification 854
Deforestation 855
- 48.4** Effects of Pollutants 856
Atmospheric Deposition 856
Biological Accumulation and Magnification 857
Talking Trash 858
- 48.5** Ozone Depletion and Pollution 858
Depletion of the Ozone Layer 858
Near-Ground Ozone Pollution 859
- 48.6** Effects of Global Climate Change 859
- 48.7** Conservation Biology 860
The Value of Biodiversity 860
Setting Priorities 861
Preservation and Restoration 862
- 48.8** Reducing Negative Impacts 862

Appendices

- | | |
|--------------|--|
| Appendix I | Periodic Table of the Elements 866 |
| Appendix II | The Amino Acids 867 |
| Appendix III | A Closer Look at Some Major Metabolic Pathways 868 |
| Appendix IV | A Plain English Map of the Human Chromosomes 871 |
| Appendix V | Restless Earth—Life's Changing Geologic Stage 872 |
| Appendix VI | Units of Measure 874 |
| Appendix VII | Answers to Self-Quizzes and Genetics Problems 875 |
| Glossary | 880 |

Preface

A revolution in the way information is shared has fundamentally changed the nature of biological inquiry. Interdisciplinary collaborations facilitated by instant, global access to data and ideas have fostered entirely new areas of research, both theoretical and practical. New discoveries and new technologies emerging from these collaborations are altering the way biologists think about their work—and the field in general.

Realizing that a traditional life science education would not adequately prepare students for the changing field, the American Association for the Advancement of Science and the National Science Foundation initiated a series of national conversations among leading life scientists, policymakers, educators, and students. The result was a document, “Vision and Change in Undergraduate Biology Education,” that calls for a fundamental change in the way life sciences are taught to undergraduate students. A broad consensus recommends that science education become much more active, because personal experience with the process and limits of science better prepares students to evaluate scientific content and differentiate it from other information. A more concept-oriented approach that uses fundamental biological principles as a context for information (rather than the reverse) better prepares students to understand the rapidly changing field. Our future citizens and leaders will need this understanding to confront urgent societal problems such as climate change, threats to biodiversity, and the global spread of disease.

This book has been revised in alignment with “Vision and Change” recommendations. As always, recent discoveries are integrated in an accessible and appealing introduction to the study of life. This edition also includes tools to explore core biological concepts from a variety of perspectives (molecular, cellular, organismal, ecological, and so on).

Features of This Edition

Setting the Stage

Each chapter opens with a dramatic photo. A brief Links to Earlier Concepts paragraph reminds students of relevant information in previous chapters. A summary of chapter content is organized and presented in terms of Core Concepts: evolution; information flow; systems; pathways of transformation; structure/function; or the process of science.

Section-Based Learning Objectives

The content of every chapter is organized as a series of sections. Learning Objectives associated with each section are phrased as activities that the student should be able to carry out after reading the text.

On-Page Glossary

An On-Page Glossary includes boldface key terms introduced in each section. This section-by-section glossary offers pronunciations, definitions in alternate wording, and it can be used as a quick study aid. All glossary terms also appear in boldface in the Chapter Summary.

Emphasis on Relevance

We continue to focus on real-world applications, including social issues arising from new research and developments—particularly the many ways in which human activities continue to alter the environment and threaten both human health and Earth’s biodiversity. Each chapter begins and ends with a section that explains a current topic in light of the chapter content.

Self-Assessment Tools

Many figure captions include a Figure-It-Out question designed to engage students in an active learning process; an upside-down answer allows a quick check of understanding. At the end of each chapter, Self-Quiz and Critical Thinking Questions provide additional self-assessment material. Another active-learning feature, the in-text Data Analysis Activity, sharpens analytical skills by asking the student to interpret data presented in graphic or tabular form. The data is presented with relevant chapter content, and is from a published scientific study in most cases.

Some Updates in This Revision

- 1 Invitation to Biology** Expanded section “The Nature of Science” includes new, detailed coverage of pseudoscience and how it differs from science.
- 2 Life’s Chemical Basis** New table compares elemental composition of the human body with Earth’s crust, seawater, and the universe. Updated art more clearly demonstrates vacancies. New art illustrates and compares bond polarity.
- 3 Molecules of Life** Revised text further emphasizes levels of protein structure as related to protein function. New art illustrates patterns of secondary structure; new content reflects current research elucidating misfolded prion structure and pathogenesis of amyloid diseases.
- 4 Cell Structure** New, major art depicts interactions among components of the endomembrane system. New art reveals ultrastructural details of cell junctions per recent discoveries. New photos illustrate a beneficial biofilm, cuticle, and basement membrane. Expanded section on the nature of life now includes theory of living systems.
- 5 Ground Rules of Metabolism** New photos and art use firefly luciferase to illustrate energy flow in metabolism. Updated art clarifies selective permeability of cell membranes and tonicity, and directional orientation of membrane proteins during exocytosis. Expanded coverage of ATP as a coenzyme.
- 6 Where It Starts—Photosynthesis** Chapter has been reorganized for a better introductory sequence. New art illustrates a special pair, light-harvesting complex, and cyclic photophosphorylation. Expanded discussion of the cyclic pathway emphasizes the interplay between both versions of light reactions, and the evolutionary significance of dual pathways. Expanded discussion of photorespiration incorporates new research on its adaptive value.

- 7 Releasing Chemical Energy** Art updated throughout. New introductory table and art in each section detail inputs and outputs linking steps in aerobic respiration. Revised diagram better illustrates dual PGAL breakdown in glycolysis. New Data Analysis Activity concerns reprogramming of mitochondria in brown fat by dietary fat overload.
- 8 DNA Structure and Function** Nucleotide structure art revised to better illustrate composition and two-dimensional accuracy. Updated art including model of a pyrimidine dimer clarifies how replication errors become mutations.
- 9 From DNA to Protein** New art illustrates the overall structure of a gene and its relationship to RNA translated from it. New table compares DNA and RNA. Revised art better illustrates post-transcriptional modification; major translation figure updated to clarify elongation and polysomes. Expanded section on mutations includes material on a beneficial hemoglobin mutation (E6K, HbC) that offers resistance to malaria without the health consequences of HbS; and how a mutation in a regulatory site (an intron) can affect gene expression (resulting in hairlessness in cats).
- 10 Control of Gene Expression** Updated art better illustrates points of control in eukaryotic gene expression. New flow chart shows gene expression cascade in *Drosophila* development; new art illustrates random nature of X chromosome inactivation. Added coverage of circadian cycles of gene expression; expanded discussion reflects current understanding of epigenetic mechanisms.
- 11 How Cells Reproduce** New ultra-high resolution confocal live-cell images better illustrate mitosis and the spindle. Cell cycle illustration now correlated with illustration of ploidy changes in mitosis. Revised text and art showing cytokinesis include ultrastructural details/processes per current research and paradigms. Expanded material on telomeres now includes telomere-associated triggering and consequences of senescence.
- 12 Meiosis and Sexual Reproduction** New figure illustrates how fertilization restores the chromosome number. Newly discovered mechanism of gene acquisition by individual rotifers added to revisited section.
- 13 Observing Patterns in Inherited Traits** Marfan syndrome discussion updated to reflect change in life expectancy due to increased awareness, accompanied by new photo of former Baylor University basketball star Isaiah Austin.
- 14 Chromosomes and Human Inheritance** Molecular pathogenesis of Huntington's and DMD updated to reflect current research. Table of genetic abnormalities now broken by section. Updated art better depicts chromosome structural changes.
- 15 Studying and Manipulating Genomes** Art depicting recombinant DNA production and reverse transcription revised for clarity. Art and text revised to include structure and utility of eukaryotic expression vectors. New figure illustrates exponential amplification of DNA by PCR. New table lists human genome statistics. Gene therapy section revised to include mechanism, application, and social implications of CRISPR-Cas9 gene editing.
- 16 Evidence of Evolution** Cetacean evolutionary sequence updated to reflect currently accepted narrative. Current research informed revisions of plate tectonics art. Paleogeography art revised to show Mercator projections.
- 17 Processes of Evolution** Updated material on antibiotic resistance and overuse of antibiotics in livestock. Illustration of HbS allele frequency vs. incidence of malaria updated to reflect recent data in Gabon. New photo of bumblebee on white sage flower added to mechanical isolation figure. Discussion of sympatric speciation in wheat revised to reflect current research.
- 18 Organizing Information About Species** Phylogeny section and parsimony analysis figure revised for clarity. Convergent and divergent evolution terminology introduced. New photo of stem reptile fossil added to divergent evolution figure. New close-up of saguaro cactus spines juxtaposed with Euphorbia spines for better illustration of convergent evolution.
- 19 Life's Origin and Early Evolution** Expanded coverage of the Precambrian, including timeline. Updated information about the possibility of an RNA world, the earliest proposed fossil life, and the archaeal and bacterial ancestors of eukaryotes. New Data Analysis Activity about the effect of some antibiotics on mitochondria.
- 20 Viruses, Bacteria, and Archaea** New opening essay about the human microbiota. Improved art comparing viral structures. Updated information about Ebola, AIDS, and Zika virus. Updated figure showing binary fission. New figure illustrating mechanisms of horizontal gene transfer in prokaryotes. New section about bacteria as pathogens. New Data Analysis Activity about antibiotics inspired by the study of bacteriophages.
- 21 The Protists** Chapter reorganized to reflect our current understanding of the major eukaryotic supergroups. New overview of protist cell structure.
- 22 Plant Evolution** Revised life cycle graphics throughout the chapter; improved figure illustrating generalized process of seed production.
- 23 Fungi** Added photos of athlete's foot and ringworm. Updated information about white nose syndrome. Increased coverage of the use of fungi in food production, research, biotechnology, and as sources of medicine.
- 24 Animals I: Major Invertebrate Groups** Added information about sponge regeneration. New figure showing schistosomes. Coverage of placozoans, rotifers, and tardigrades deleted.
- 25 Animals II: The Chordates** New information about bone loss in the evolution of cartilaginous fishes.
- 26 Human Evolution** Updated information about fossil hominids, including discussion of Denisovans and *Homo naledi*.
- 27 Plant Tissues** New art includes illustration of stem structure and location of the vascular cylinder in a root.

- 28 Plant Nutrition and Transport** Added information about use of phytoremediation at Fukushima. New micrographs and associated art detail the flow of water through xylem cells. Updated translocation art coordinates with new art illustrating sieve tube structure.
- 29 Life Cycles of Flowering Plants** Detail added to plant life cycle art for accuracy. New photo illustrates root suckers.
- 30 Communication Strategies in Plants** Current research informed updates to mechanisms of hormonal action. Table summarizing plant hormones has been broken by section. Added material includes the role of ABA in stress-related stomata closure; nastic movements and accompanying new photos; and explanation of *Phylloxera* resistance in American grapevines based on enhanced hypersensitive response involving resveratrol.
- 31 Animal Tissues and Organ Systems** New summary table describing tissue types. Improved graphic illustrating relative volumes of the fluid components of a human body. New information about brown fat versus white fat and white matter and gray matter. Updated information about research on and clinical use of induced pluripotent stem cells (iPSCs) and about transdifferentiation as an alternative source of replacement cells.
- 32 Neural Control** Updated information about brain damage among professional football players. New opening overview of intracellular signaling mechanisms. Revised/reorganized coverage of the peripheral nervous system. New subsection covers tissues and fluid of the CNS; information about neuroglia moved here.
- 33 Sensory Perception** Updated illustration/discussion of retina anatomy to include light-channeling neuroglia.
- 34 Endocrine Control** Added information about sites of human steroid hormone production (gonads/adrenals). Consolidated information about hormones in a single table. Moved discussion of pineal gland to follow discussion of pituitary/hypothalamus. Deleted coverage of the thymus. New Data Analysis Activity covers the disruptive effect of BPA on insulin secretion.
- 35 Structural Support and Movement** Improved figures depicting locomotion of fly and earthworm. Revised figure showing the structure of skeletal muscle.
- 36 Circulation** Updated photo depicting measurement of blood pressure. Expanded coverage of venule function. New art depicting atherosclerosis. Added discussion of heart attack symptoms and of causes and symptoms of stroke. New Data Analysis Activity on how hypertension affects the risk of stroke and heart attack.
- 37 Immunity** New application section that details vaccination and benefits of herd immunity features a narrative about an unvaccinated child with permanent health consequences of contracting measles. New photos illustrate microbial sectors of a dental plaque biofilm, agglutination, and anaphylaxis. Revised art better illustrates specificity of antigen binding sites in antibodies. New content includes role of keratinocytes as immune cells in contact allergies.
- 38 Respiration** Improved photo of insect tracheal system. Increased emphasis on evolutionary trends in vertebrate lung structure. Added information about the risks of vaping. New Data Analysis Activity addresses effects of tobacco and marijuana smoke on the lungs.
- 39 Digestion and Human Nutrition** New opening essay about the role of human digestive enzymes and genetic variations in these enzymes. Added coverage of sponge digestion with new graphic. New figure compares length of digestive tract regions in a mammalian carnivore and herbivore. New graphics depict peristalsis and segmentation. Coverage of beneficial gut microflora moved to the section about the large intestine.
- 40 Maintaining the Internal Environment** Material reorganized with separate sections describing formation and types of wastes and types of excretory organs. Variations on kidney structure in fish and desert rat kidneys now covered in a separate section after discussion of human kidney structure. Added information about human body hair as a temperature-related adaptation. Deleted coverage of human variation in sodium reabsorption.
- 41 Animal Reproduction** Updated information about STDs, including new discussion of *Mycoplasma genitalium* infection.
- 42 Animal Development** Morphogens now discussed in the context of embryonic induction. Added information about the teratogenic effects of the Zika virus.
- 43 Animal Behavior** New information about epigenetic effects in a variety of contexts. Improved honeybee dance language figure. New information about tent caterpillars, a pre-social species. Added information about reciprocal altruism.
- 44 Population Ecology** New information about research indicating that human hunting altered the life-history traits of woolly mammoths. Updated human population statistics.
- 45 Community Ecology** Added coverage and photos of sundews and spiders that compete for insect prey. Updated photo of Surtsey.
- 46 Ecosystems** Updated information about the increasing level of atmospheric carbon dioxide and the evidence that human activities are responsible for this increase.
- 47 The Biosphere** Updated information about the movement of radioactive compounds released at Fukushima. Figure depicting seasonal overturn in a lake revised. Increased coverage of the importance of dissolved oxygen in aquatic habitats. New coverage of ocean acidification as a threat to reefs.
- 48 Human Effects on the Biosphere** New opening section about the proposal to recognize human effects by naming a new geological epoch—the Anthropocene. New Data Analysis Activity about bioaccumulation of radioactive materials in tuna. Revised, updated coverage of biodiversity hotspots. New closing section about how citizen science can help document the distribution and decline of biodiversity.

Student and Instructor Resources

MindTap

MindTap is an outcome-driven application that propels students from memorization to mastery. MindTap is the only platform that gives you complete ownership of your course—to provide engaging content, to challenge every individual, and to build students' confidence.

MindTap brings ultimate convenience for students and instructors by allowing you to access everything in one place. In addition, the MindTap Mobile App gives students complete flexibility to read, listen, and study anytime, anywhere on their phones—and learn on their terms.

MindTap for Biology: The Unity and Diversity of Life 15e

The MindTap Learning Path includes these engaging learning opportunities in every chapter, and more!

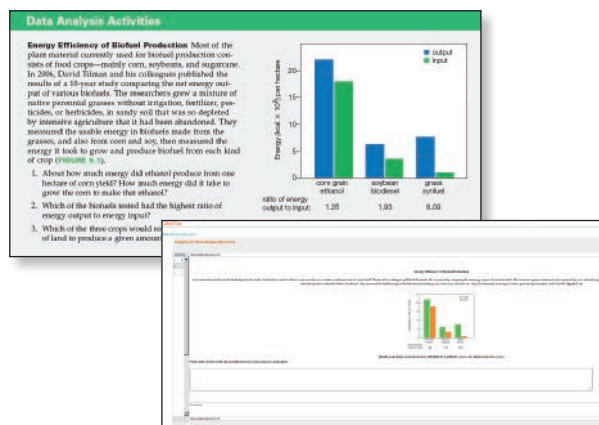

Make It Relevant

Based on the chapter core applications, the popular *How Would You Vote?* feature provides scenarios for further research and critical thinking on topics that show the relevance of biology to student lives. After reading the chapter, students can revisit their original vote in a follow-up activity called *How Would You Vote Now?*

Assign and Grade Content that Matters

The following activities are included and can be set to auto-graded using a simple button-click.

- **Data Analysis Activities** are fully assignable in MindTap! Ensure your students are sharpening their analytical skills by assigning these engaging activities. The data is related to the chapter material, and is taken from a published scientific study in most cases. Other assignable and gradable activities in every chapter include:
 - **Conceptual Learning Assignments**
 - **Critical Thinking Questions**
 - **Chapter Test**

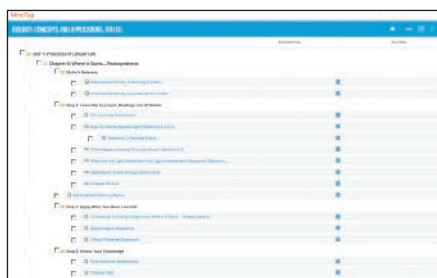

Data Analysis activities in every chapter...assigned in MindTap.

Just for Students: Study and Practice

The new MindTap features two sets of activities to ensure students are not only doing the reading but are also engaging and learning the topics.

- **Student Study Card** For each section in every chapter, students read a brief summary, complete answers to learning objective “quick-checks” and get immediate feedback on their responses. Direct links to media related to the section content are included for many sections.
- **Study Guide** For student practice only; this set of detailed questions provides students further practice on the topics in each section.

MindTap is fully customizable to meet your course goals. Easily assign students the content you want them to learn, in the order you want them to learn it.

Make it your own. Insert your own materials—slides, videos, and lecture notes—wherever you want your students to see them.

MindTap Course Development

Effectively introducing digital solutions into your classroom—online or on-ground—is now easier than ever. We're with you every step of the way.

Our Digital Course Support Team

When you adopt from Cengage Learning, you have a dedicated team of Digital Course Support professionals, who will provide hands-on start-to-finish support, making digital course delivery a success for you and your students.

“The technical support provided by Cengage staff in using MindTap was superb. The Digital Support Team was proactive in training and prompt in answering follow-up questions.” —K. Sata Sathasivan, The University of Texas at Austin

Instructor Companion Site

Everything you need for your course in one place! This collection of book-specific lecture and class tools is available online via www.cengagebrain.com/login. Access and download PowerPoint presentations, images, instructor's manuals, videos, test banks, and more.

Acknowledgments

Writing, revising, and illustrating a biology textbook is a major undertaking for two full-time authors, but our efforts constitute only a small part of what is required to produce and distribute this one. We are truly fortunate to be part of a huge team of very talented people who are as committed as we are to creating and disseminating an exceptional science education product.

Biology is not dogma; paradigm shifts are a common outcome of the fantastic amount of research in the field. Ideas about what material should be taught and how best to present that material to students changes even from one year to the next. It is only with the ongoing input of our many academic reviewers and advisors (see the list of Class Testers and Reviewers for this edition, right) that we can continue to tailor this book to the needs of instructors and students while integrating new information and models. We continue to learn from and be inspired by these dedicated educators.

Thanks to Hal Humphrey, Production Manager; Jake Warde, Content Developer; Tom Ziolkowski, Marketing Manager; and Marina Starkey, Product Assistant. Thank you also to Cheryl DuBois and Christine Myaskovsky for help with photo research.

Lisa Starr and Christine Evers, August 2017

Cengage acknowledges and appreciates Lisa Starr's contribution of more than 300 pieces of art to this edition.

Molecular Structure Reference Data

Structural models in this book were rendered using the following data from RCSB PDB (www.rcsb.org, Berman, H.M., Westbrook, J., Feng, Z., Gilliland, G., Bhat, T.N., Weissig, H., Shindyalov, I.N., Bourne, P.E. (2000) The Protein Data Bank. *Nucleic Acids Research*, 28: 235-242) and The Protein Model DataBase (Castrignano, T., De Meo, P.D., Cozzetto, D., Talamo, I.G., Tramontano, A. BIOLOGY

The Unity and Diversity of Life

15TH EDITION

STARR

TAGGART

EVERS

STARR

1 INVITATION TO BIOLOGY

© 2015 Pearson Education, Inc. All Rights Reserved. National Geographic Learning

CORE CONCEPTS

Systems

Complex properties arise from interactions among components of a biological system.

We can understand life by studying it at increasingly inclusive levels, starting with atoms that compose matter, and extending to the biosphere. Each level is a biological system composed of interacting parts. Interactions among the components of a system give rise to complex properties not found in any of the components. The movement of matter and energy through ecosystems influences interactions among organisms and their environment.

Evolution

Evolution underlies the unity and diversity of life.

Shared core processes and features that are widely distributed among organisms provide evidence that all living things are linked by lines of descent from common ancestors. All biological systems are sustained by the exchange of matter and energy; all store, retrieve, transmit, and respond to information essential for life.

Process of Science

The field of biology consists of and relies upon experimentation and the collection and analysis of scientific evidence.

Science addresses only testable ideas about observable events and processes. Observation, experimentation, quantitative analysis, and critical thinking are key aspects of scientific research. Carefully designed experiments that yield objective data help researchers unravel cause-and-effect relationships in complex biological systems.

Links to Earlier Concepts

Whether or not you have studied biology, you already have an intuitive understanding of life on Earth because you are part of it. Every one of your experiences with the natural world—from the warmth of the sun on your skin to the love of your pet—contributes to that understanding.

1.1 Application: Secret Life of Earth

In this era of cell phone GPS, could there possibly be any places left on Earth that humans have not yet explored? Actually, there are plenty. Consider a 2-million-acre cloud forest in the Foja Mountains of New Guinea that was not penetrated by humans until 2005. Since then, about forty new **species**—unique types of organisms—have been discovered there, including a rhododendron plant with flowers the size of dinner plates, a rat the size of a cat, and a frog the size of a pea. Also discovered among the forest's inhabitants were hundreds of species on the brink of extinction in other parts of the world, and some that supposedly had been extinct for decades. A few new or rare species were discovered accidentally, as animals that had never learned to be afraid of humans wandered casually through campsites (**FIGURE 1.1**).

How do we know what species a particular organism belongs to? What is a species, anyway, and why should discovering a new one matter to anyone other than a biologist? You will find the answers to such questions in this book. They are part of the scientific study of life, **biology**, which is one of many ways we humans try to make sense of the world around us. Ironically, the more we learn about the natural world, the more we realize we have yet to learn. But don't take our word for it. Find out what biologists know, and what they do not, and you will have a solid foundation upon which to base your own opinions about how humans fit into this world. By reading this book, you are choosing to learn about the human connection—your connection—with all life on Earth. ●

FIGURE 1.1 The Pinocchio frog. Biologist Paul Oliver discovered this tiny tree frog perched on a sack of rice during the first survey of a cloud forest in New Guinea. It was named after the Disney character because the male frog's long nose inflates and points upward during times of excitement.

biology The scientific study of life.

species (SPEE-sheez) A unique type of organism.

1.2 Life Is More Than the Sum of Its Parts

LEARNING OBJECTIVES

- Describe the successive levels of life's organization.
- Explain the idea of emergent properties and give an example.

Biologists study life. What, exactly, is “life?” We may never actually come up with a concise definition, because living things are too diverse, and they consist of the same basic components as nonliving things. When we try to define life, we end up with a long list of complex properties that differentiate living from nonliving things. These properties often emerge from the interactions or arrangements of basic components (FIGURE 1.2).

Consider a complex behavior called swarming that is characteristic of honeybees. When bees swarm, they fly en masse to establish a hive in a new location. Each bee is autonomous, but the new hive's location is decided collectively based on an integration of signals from hivemates. A characteristic of a system (a swarm's collective intelligence, for example) that does not appear in any of the system's components (individual bees) is called an **emergent property**.

FIGURE 1.2 The same materials, assembled in different ways, form objects with different properties. The property of “roundness” emerges when these squares are assembled in a certain way.

atom The smallest unit of a substance; composes matter.

biosphere (BY-oh-sfeer) All regions of Earth where organisms live.

cell Smallest unit of life.

community All populations of all species in a defined area.

ecosystem A community interacting with its environment.

emergent property (ee-MERGE-ent) A characteristic of a system that does not appear in any of the system's components.

molecule (MAUL-ick-yule) Two or more atoms bonded together.

organ In multicelled organisms, a structure that consists of tissues engaged in a collective task.

organism (ORG-uh-niz-um) An individual that consists of one or more cells.

organ system In multicelled organisms, a set of interacting organs that carry out a particular body function.

population A group of interbreeding individuals of the same species living in a defined area.

tissue In multicelled organisms, specialized cells organized in a pattern that allows them to perform a collective function.

Life's Organization

Biologists view life in increasingly inclusive levels of organization (FIGURE 1.3). This organization begins with the **atom** ①, the smallest unit of a substance. Atoms and the fundamental particles that compose them are the building blocks of all matter. Atoms bond together to form **molecules** ②. There are no atoms unique to living things, but there are unique molecules. A **cell** ③, which is the smallest unit of life, consists of many of these “molecules of life.”

Some cells live and reproduce independently. Others do so as part of a multicelled organism. An **organism** is an individual that consists of one or more cells ⑦. In most multicelled organisms, cells are organized as tissues ④. A **tissue** consists of specific types of cells organized in a particular pattern. The arrangement allows the cells to collectively perform a special function such as protection from injury (dermal tissue) or movement (muscle tissue).

An **organ** is a structure composed of tissues that collectively carry out a particular task or set of tasks ⑤. An **organ system** is a set of interacting organs and tissues that fulfill one or more body functions ⑥. Examples of organ systems include the aboveground parts of a plant (the shoot system), and the heart and blood vessels of an animal (the circulatory system).

A **population** is a group of interbreeding individuals of the same species living in a given area. For example, all of the California poppies growing in California's Antelope Valley Poppy Reserve form a population ⑧. A **community** consists of all populations of all species in a given area. The Antelope Valley Reserve community includes the California poppy population, as well as populations of other plants, animals, microorganisms, and so on ⑨. Communities may be large or small, depending on the area defined.

The next level of organization is the **ecosystem**, which is a community interacting with its physical and chemical environment ⑩. Earth's largest ecosystem is the **biosphere**, and it encompasses all regions of the planet's crust, waters, and atmosphere in which organisms live ⑪.

TAKE-HOME MESSAGE 1.2

- ✓ Biologists study life by thinking about it at successive levels of organization. Emergent properties occur at each level.
- ✓ All matter consists of atoms. Atoms join as molecules, and molecules make up cells. The cell is the smallest unit of life.
- ✓ Organisms, populations, communities, ecosystems, and the biosphere are successively higher levels of life's organization.

1 Atom

Atoms and the particles that compose them make up all matter.

2 Molecule

Atoms join other atoms in molecules. This is a model of a water molecule. The molecules special to life are much larger and more complex than water.

3 Cell

The cell is the smallest unit of life. Some, like these plant cells, live and reproduce as part of a multicelled organism; others do so on their own.

4 Tissue

An organized array of cells that interact in a collective task. This is dermal tissue on the outer surface of a flower petal.

5 Organ

A structural unit of interacting tissues. Flowers are the reproductive organs of some plants.

6 Organ system

A set of interacting organs. The shoot system of this poppy plant includes its aboveground parts: leaves, flowers, and stems.

7 Multicelled organism

An individual that consists of more than one cell. Cells of this California poppy plant make up its shoot system and root system.

8 Population

A group of single-celled or multicelled individuals of a species in a given area. This population of California poppy plants is in California's Antelope Valley Poppy Reserve.

9 Community

All populations of all species in a specified area. These plants are part of the community in the Antelope Valley Poppy Reserve.

10 Ecosystem

A community interacting with its physical environment through the transfer of energy and materials. Sunlight and water sustain the community in the Antelope Valley.

11 Biosphere

The sum of all ecosystems: every region of Earth's waters, crust, and atmosphere in which organisms live.

FIGURE 1.3 Levels of life's organization.

Emergent properties appear at each successive level.

FIGURE IT OUT At which level does the emergent property of "life" appear?

Answer: The cell

1.3 How Living Things Are Alike

LEARNING OBJECTIVES

- Distinguish producers from consumers.
- Explain why homeostasis is important for sustaining life.
- Explain how DNA is the basis of similarities and differences among organisms.

All living things share a particular set of key features. You already know one of these features: Because the cell is the smallest unit of life, all organisms consist of at least one cell. For now, we introduce three more: All living things require ongoing inputs of energy and raw materials; all sense and respond to change; and all use DNA as the carrier of genetic information (TABLE 1.1).

TABLE 1.1

Some Key Features of Life

Cellular basis	All living things consist of one or more cells.
Requirement for energy and nutrients	Life is sustained by ongoing inputs of energy and nutrients.
Homeostasis	Living things sense and respond to change.
DNA is hereditary material	Genetic information in the form of DNA is passed to offspring.

Organisms Require Energy and Nutrients

Not all living things eat, but all require energy and nutrients on an ongoing basis. A **nutrient** is a substance that an organism needs for growth and survival but cannot make for itself.

Both nutrients and energy are essential to maintain the organization of life, so organisms spend a lot of time acquiring them. However, the source of energy and the type of nutrients required differ among organisms. These differences allow us to classify all living things into two categories: producers and consumers (FIGURE 1.4). A **producer** makes its own food using energy and simple raw materials it obtains from non-biological sources ①. Plants are producers. By a process called **photosynthesis**, plants can use the energy of sunlight to make sugars from carbon dioxide (a gas in air) and water. Consumers, by contrast, cannot make their own food. A **consumer** obtains energy and nutrients by feeding on other organisms ②. Animals are consumers. So are decomposers, which feed on the wastes or remains of other organisms. Leftovers from consumers' meals end up in the environment, where they serve as nutrients for producers. Said another way, nutrients cycle between producers and consumers ③.

Unlike nutrients, energy is not cycled. It flows through the world of life in one direction: from the

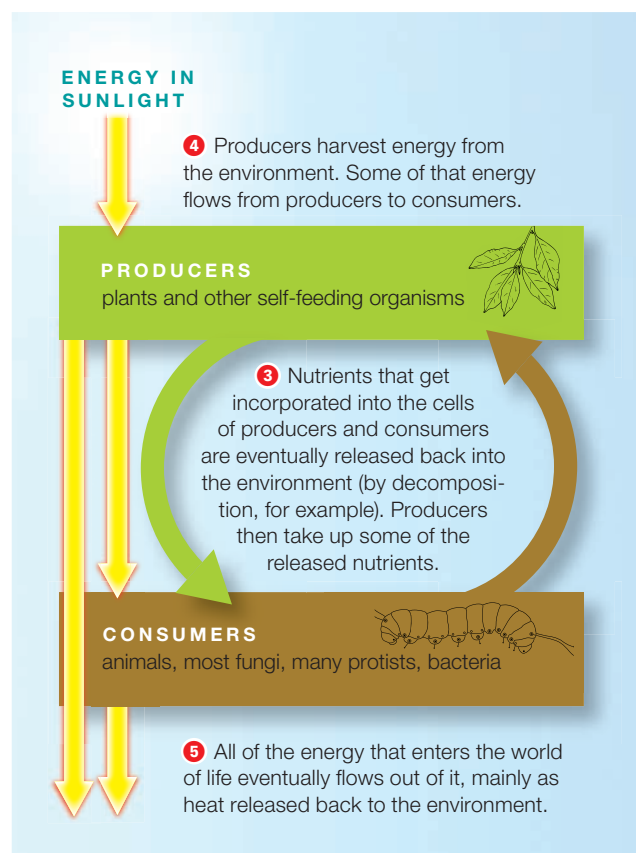

FIGURE 1.4 The one-way flow of energy and cycling of materials through the world of life.

environment ④, through organisms, and then back to the environment ⑤. This flow maintains the organization of every living cell and body, and it also influences how individuals interact with one another and their environment. The energy flow is one way, because with each transfer, some energy escapes as heat, and cells

cannot use heat as an energy source. Thus, energy that enters the world of life eventually leaves it (we return to this topic in Chapter 5).

Homeostasis

An organism cannot survive for very long unless it responds appropriately to specific stimuli inside and outside of itself. For example, humans and some other animals normally perspire (sweat) when the body's internal temperature rises above a certain set point (**FIGURE 1.5**). The moisture cools the skin, which in turn helps cool the body.

All of the internal fluids that bathe the cells in your body are collectively called your internal environment. Temperature and many other conditions in that environment must be kept within certain ranges, or your cells will die (and so will you). By sensing and adjusting to change, all organisms keep conditions in their internal environment within ranges that favor cell survival. **Homeostasis** is the name for this process, and it is one of the defining features of life.

DNA Is Hereditary Material

With little variation, the same types of molecules perform the same basic functions in every organism. For example, information in an organism's **DNA** (deoxyribonucleic acid) guides ongoing cellular activities that sustain the individual through its lifetime. Such functions include **development**: the process by which the first cell of a new individual gives rise to a multicelled adult; **growth**: increases in cell number, size, and volume; and **reproduction**: processes by which organisms produce offspring. **Inheritance**, the transmission of DNA to offspring, occurs during reproduction. All organisms inherit their DNA from one or more parents.

consumer (kun-SUE-murr) An organism that gets energy and nutrients by feeding on tissues, wastes, or remains of other organisms.

development (dih-VELL-up-ment) Processes by which the first cell of a multicelled organism gives rise to an adult.

DNA Deoxyribonucleic (dee-ox-ee-ribe-oh-new-CLAY-ick) acid; molecule that carries hereditary information; guides development and other activities.

growth Increase in the number, size, and volume of cells.

homeostasis (home-ee-oh-STAY-sis) Process in which organisms keep their internal conditions within tolerable ranges by sensing and responding appropriately to change.

inheritance (in-HAIR-ih-tunce) Transmission of DNA to offspring.

nutrient (NEW-tree-unt) A substance that an organism acquires from the environment to support growth and survival.

photosynthesis (foe-toe-SIN-thuh-sis) Process by which producers use light energy to make sugars from carbon dioxide and water.

producer An organism that makes its own food using energy and nonbiological raw materials from the environment.

reproduction (ree-pruh-DUCK-shun) Processes by which organisms produce offspring.

FIGURE 1.5 Living things sense and respond to their environment. Sweating is a physiological response to an internal body temperature that exceeds the normal set point. The response cools the skin, which in turn helps return the internal temperature to the set point.

Individuals of every natural population are alike in most aspects of body form and behavior because their DNA is very similar: Humans look and act like humans and not like poppy plants because they inherited human DNA, which differs from poppy plant DNA in the information it carries. Individuals of almost every natural population also vary—just a bit—from one another: One human has blue eyes, the next has brown eyes, and so on. Such variation arises from small differences in the details of DNA molecules, and herein lies the source of life's diversity. As you will see in later chapters, differences among individuals of a species are the raw material of evolutionary processes.

TAKE-HOME MESSAGE 1.3

- ✓ A one-way flow of energy and a cycling of materials maintain life's complex organization.
- ✓ Organisms sense and respond to conditions inside and outside themselves. They make adjustments that keep conditions in their internal environment within a range that favors cell survival, a process called homeostasis.
- ✓ All organisms use information in the DNA they inherited from their parent or parents to develop, grow, and reproduce. DNA is the basis of similarities and differences among organisms.

A Bacteria are the most numerous organisms on Earth. Clockwise from upper left, a bacterium with a row of iron crystals that serves as a tiny compass; a common bacterial resident of cat and dog stomachs; photosynthetic bacteria; bacteria found in dental plaque.

B Archaea resemble bacteria, but are more closely related to eukaryotes. Left, an archaeon that grows in sulfur hot springs. Right, two types of archaea from a seafloor hydrothermal vent.

FIGURE 1.6 A few representative prokaryotes.

1.4 How Living Things Differ

LEARNING OBJECTIVES

- List two characteristics of prokaryotes.
- Name the four main groups of eukaryotes.

You will see in later chapters how differences in the details of DNA molecules are the basis of a tremendous range of differences among types of organisms. Various classification schemes help us organize what we understand about this variation, which is an important aspect of Earth's biodiversity. For example, organisms can be grouped on the basis of whether they have a nucleus, which is a sac-like structure that contains a cell's DNA. **Bacteria** (singular, bacterium) and **archaea** (singular, archaeon) are the organisms whose DNA is *not* contained within a nucleus (**FIGURE 1.6**). All bacteria and archaea are single-celled, which means each individual consists of one cell. Collectively, these organisms are the most diverse representatives of life. Different kinds are producers or consumers in nearly all regions of Earth. Some inhabit such extreme

environments as frozen desert rocks, boiling sulfurous lakes, and nuclear reactor waste. The first cells on Earth may have faced similarly hostile conditions.

Traditionally, organisms without a nucleus have been classified as **prokaryotes**, but the designation is now used only informally. This is because bacteria and archaea are less related to one another than we once thought, despite their similar appearance. Archaea turned out to be more closely related to **eukaryotes**, which are organisms whose DNA is contained within a nucleus. Some eukaryotes live as individual cells; others are multicelled. Eukaryotic cells are typically larger and more complex than prokaryotes.

There are four main groups of eukaryotes: protists, fungi, plants, and animals (**FIGURE 1.7**).

Protist is the common term for a collection of eukaryote groups that are not plants, animals, or fungi. Collectively, they vary dramatically, from single-celled consumers to giant, multicelled producers.

Fungi (singular, fungus) are eukaryotic consumers that secrete substances to break down food externally, then absorb nutrients released by this process. Many fungi are decomposers. Most fungi, including those that form mushrooms, are multicellular. Fungi that live as single cells are called yeasts.

Plants are multicelled eukaryotes, and the vast majority of them are photosynthetic producers that live on land. Besides feeding themselves, plants also serve as food for most other land-based organisms.

Animals are multicelled consumers that ingest other organisms or components of them. Unlike fungi, animals break down food inside their body. They also develop through a series of stages that lead to the adult form. All animals actively move about during at least part of their lives.

animal A multicelled consumer that develops through a series of stages and moves about during part or all of its life.

archaea (are-KEY-uh) Singular, archaeon. Group of single-celled organisms that lack a nucleus but are more closely related to eukaryotes than to bacteria.

bacteria Singular, bacterium. The most diverse and well-known group of single-celled organisms that lack a nucleus.

eukaryote (you-CARE-ee-oat) An organism whose cells characteristically have a nucleus.

fungus Plural, fungi. A single-celled or multicelled eukaryotic consumer that breaks down material outside itself, then absorbs nutrients released from the breakdown.

genus (JEE-nuss) Plural, genera. A group of species that share a unique set of traits.

plant A multicelled eukaryotic producer; typically photosynthetic.

prokaryote (pro-CARE-ee-oat) A single-celled organism without a nucleus.

protist Common term for a eukaryote that is not a plant, animal, or fungus.

specific epithet Second part of a species name.

taxonomy (tax-ON-oh-me) The practice of naming and classifying species.

trait An inherited characteristic of an organism or species.

Protists are a group of extremely diverse eukaryotes that range from microscopic free-living cells (left) to giant multicelled seaweeds (right).

Fungi are eukaryotic consumers that secrete substances to break down food outside their body. Some are single-celled (left); most are multicelled (right).

Plants are multicelled eukaryotes, most of which are photosynthetic. Nearly all have roots, stems, and leaves.

Animals are multicelled eukaryotes that ingest other organisms or their parts, and they actively move about during part or all of their life cycle.

FIGURE 1.7 A few representative eukaryotes.

TAKE-HOME MESSAGE 1.4

- ✓ Details of appearance and other characteristics vary greatly among living things.
- ✓ Bacteria and archaea are organisms whose DNA is not contained in a nucleus. All are single-celled.
- ✓ Protists, fungi, plants, and animals are eukaryotes: organisms whose DNA is contained in a nucleus. Most are multicelled.

1.5 Organizing Information About Species

LEARNING OBJECTIVES

- Explain how organisms are named in the Linnaean system.
- Describe the way species are classified in taxa.
- List the taxa from species to domain.
- Describe the “biological species concept” and explain its limitations.

A Rose by Any Other Name . . .

Each time we discover a new species, we name it, a practice called **taxonomy**. Taxonomy began thousands of years ago, but naming species in a consistent way did not become a priority until the eighteenth century. At the time, European explorers who were just discovering the scope of life’s diversity started having more and more trouble communicating with one another because species often had multiple names. For example, the dog rose (a plant native to Europe, Africa, and Asia) was alternately known as briar rose, witch’s briar, herb patience, sweet briar, wild briar, dog briar, dog berry, briar hip, eglantine gall, hep tree, hip fruit, hip rose, hip tree, hop fruit, and hogseed—and those are only the English names! Species often had multiple scientific names too, in Latin that was descriptive but often cumbersome. The scientific name of the dog rose was *Rosa sylvestris inodora seu canina* (odorless woodland dog rose), and also *Rosa sylvestris alba cum rubore, folio glabro* (pinkish white woodland rose with smooth leaves).

An eighteenth-century naturalist, Carolus Linnaeus, standardized a naming system that we still use. By the Linnaean system, each species is given a unique two-part scientific name. The first part of a scientific name is the **genus** (plural, genera), which is defined as a group of species that share a unique set of features. The second part of the name is the **specific epithet**. Together, the genus name and the specific epithet designate one species. Thus, the dog rose now has one official name, *Rosa canina*, that is recognized worldwide.

Genus and species names are always italicized. For example, *Panthera* is a genus of big cats. Lions belong to the species *Panthera leo*. Tigers belong to a different species in the same genus (*Panthera tigris*), and so do leopards (*P. pardus*). Note how the genus name may be abbreviated after it has been spelled out.

Distinguishing Species

The individuals of a species share a unique set of inherited characteristics, or **traits**. For example, giraffes normally have very long necks, brown spots on white
