# Brief Contents

## UNIT 1 Science, Chemistry, and Cells

- 1 The Scientific Study of Life 2
- 2 The Chemistry of Life 18
- 3 Cells 44
- 4 The Energy of Life 70
- 5 Photosynthesis 88
- 6 Respiration and Fermentation 104

## UNIT 2 DNA, Inheritance, and Biotechnology

- 7 DNA Structure and Gene Function 120
- 8 DNA Replication, Binary Fission, and Mitosis 146
- 9 Sexual Reproduction and Meiosis 166
- 10 Patterns of Inheritance 186
- 11 DNA Technology 216

## UNIT 3 The Evolution of Life

- 12 The Forces of Evolutionary Change 236
- 13 Evidence of Evolution 260
- 14 Speciation and Extinction 280
- 15 The Origin and History of Life 304

## UNIT 4 The Diversity of Life

- 16 Viruses 330
- 17 Bacteria and Archaea 344
- 18 Protists 360
- 19 Plants 378
- 20 Fungi 398
- 21 Animals 416

## UNIT 5 Plant Life

- 22 Plant Form and Function 460
- 23 Plant Nutrition and Transport 482
- 24 Reproduction and Development of Flowering Plants 496

## UNIT 6 Animal Life

- 25 Animal Tissues and Organ Systems 518
- 26 The Nervous System 534
- 27 The Senses 558
- 28 The Endocrine System 574
- 29 The Skeletal and Muscular Systems 590
- 30 The Circulatory System 608
- 31 The Respiratory System 628
- 32 Digestion and Nutrition 644
- 33 Regulation of Temperature and Body Fluids 664
- 34 The Immune System 680
- 35 Animal Reproduction and Development 700

## UNIT 7 The Ecology of Life

- 36 Animal Behavior 728
- 37 Populations 748
- 38 Communities and Ecosystems 766
- 39 Biomes 788
- 40 Preserving Biodiversity 808

# About the Author

Davenport Photos

**Mariëlle Hoefnagels** is a full professor in the Department of Biology and the Department of Microbiology and Plant Biology at the University of Oklahoma, where she teaches courses in introductory biology and science writing. She has received the University of Oklahoma General Education Teaching Award, the Longmire Prize (the Teaching Scholars Award from the College of Arts and Sciences), and the Holden Faculty Award (to recognize outstanding faculty who teach freshmen and sophomores). Her textbook *Biology: Concepts and Investigations*, 4th edition, was recognized with a 2018 Textbook Excellence Award from the Textbook and Academic Authors Association. She has also been awarded honorary memberships in several student honor societies.

Dr. Hoefnagels received her B.S. in environmental science from the University of California at Riverside, her M.S. in soil science from North Carolina State University, and her Ph.D. in plant pathology from Oregon State University. Her dissertation work focused on the use of bacterial biological control agents to reduce the spread of fungal pathogens on seeds. In addition to authoring *Biology: Concepts and Investigations* and *Biology: The Essentials*, her recent publications have focused on creating investigative teaching laboratories and methods for teaching experimental design in beginning and advanced biology classes. She frequently gives presentations on study skills and related topics to student groups.

# Preface

For years, biology instructors have recognized that we need to turn away from teaching methods that reward students who memorize and regurgitate superficial knowledge. Instead, we need to emphasize deeper learning that requires students to understand and apply course content. This idea is precisely what I have tried to achieve since I started teaching at the University of Oklahoma in 1997, and it has been a guiding principle in the creation of my books and digital material as well.

This edition retains what users have always loved about this book: the art program, readable narrative, handy study tips, Investigating Life essays, tutorial animations, and concept maps. In this edition, I have explicitly connected the unit-wide Survey the Landscape concept map at the start of each chapter to the more detailed, chapter-specific Pull It Together concept map at each chapter's end. Not only does each Survey the Landscape now direct the student's attention to the Pull It Together concept map, but the latter includes a specially labeled question directing the reader's attention back to the Survey the Landscape's "big picture" view. The objective remains the same: to help students see the "forest" *and* the "trees."

One way to motivate students to learn is to help them see that biology is all around them: in food, medicine, pets, water, gardens, parks, and even vacant lots. For students interested in environmental quality, biology forms a foundation for understanding issues ranging in scale from the quality of local tap water to the changing global climate. The Burning Question and Apply It Now boxes support my efforts to help readers learn why biology matters. Each chapter now also includes one or more Scientific Literacy questions. These new thought questions at the end of each chapter will help students practice thinking like a scientist about relevant social, political, or ethical issues.

We continue to acknowledge the growing numbers of instructors and students who are embracing digital textbooks.

SmartBook® user data from thousands of students using the fourth edition helped us to identify passages that needed clarification. The user data also guided us as we created a carefully selected array of digital Learning Resources to accompany many probes in SmartBook. In addition, many chapters have bonus features for ebook users, including new digital-only miniglossaries, tables, figures, and live-action videos of plants, fungi, and animals; see the Changes by Chapter section for a complete listing of our new additions.

Ebook users will notice another new feature that supports the goal of bringing biology into student lives: a set of 12 relevancy modules that explain core biology content in the context of timely topics. Relevancy module topics span the book's units, from the process of science (Himalayan salt lamps) to organic chemistry (chocolate) to metabolism (weight gain) to cell division (cancer) to evolution (antibiotic resistance) to plant biology (mega crops) to animal biology (running a marathon) to ecology (climate change), and more. Depending on their teaching goals, instructors can assign a module before or after covering the core content and use it as a jumping-off point for class discussions or homework assignments.

I believe that one set of tools and techniques does not work in every classroom. For that reason, my team and I are proud to create a package that gives you the flexibility to teach introductory biology in a way that works best for you. The following sections illustrate the features and resources for this edition that can help you meet your teaching goals.

I hope that you and your students enjoy this text and that it helps cultivate an understanding of, and deep appreciation for, biology.

Mariëlle Hoefnagels  
The University of Oklahoma

# Author's Guide to Using this Textbook

This guide lists the main features of each chapter and describes some of the ways that I use them in my own classes.

Davenport Photos

## UNIT 2

### A Molecular Fingerprint

In the central England village of Narborough, a young woman was raped and murdered in 1983. Police collected evidence from the scene and determined the killer's blood type. However, the list of possible suspects was long, and the case went cold. In 1986, a murderer struck again. This time, police identified a 17-year-old suspect. During interrogation, the man admitted to killing the second victim, but he denied committing the first crime.

Meanwhile, University of Leicester Professor Alec Jeffreys worked to perfect a genetic comparison technique called DNA profiling. Scientists at the time did not have the tools to quickly sequence large regions of DNA, but Jeffreys' DNA profiling technique was selective. It focused only on regions of DNA known to vary from person to person, homing in on a unique molecular "fingerprint" hidden in each cell's nucleus.

A couple of months after the second murder, investigators asked Jeffreys to apply his new technique to the crime scene evidence. As expected, DNA in semen collected from the first victim matched DNA found on the second victim, indicating that both women were killed by the same man. But the DNA did not match that of the suspect in police custody. Instead, it matched that of another man, Colin Pitchfork. The innocent teen was freed, and the true killer was put behind bars.

In the decades since this pioneering case, DNA profiling has led to the conviction of many criminals. It has also proved the innocence of more than 300 wrongfully convicted people (see figure 11.9). DNA has proved to be a powerful tool in law enforcement, and scientists are likely to invent many more applications in the future.

Biologists care about DNA for other reasons as well. DNA encodes proteins, and changes in DNA can lead to protein abnormalities and diseases such as cystic fibrosis and hemophilia. DNA profiling can also help untangle family relationships. On a larger scale, analyzing differences in DNA can reveal how species are related. For example, DNA has given biologists a clearer view of what distinguishes humans from our closest relatives, the chimpanzees.

We begin this genetics unit with a look at the intimate relationship between DNA and proteins. Subsequent chapters describe how cells copy DNA just before they divide and how cell division leads to the fascinating study of inheritance. At the end of the unit, we will return to practical applications of DNA.

#### LEARNING OUTLINE

- 7.1 Experiments Identified the Genetic Material
- 7.2 DNA Is a Double Helix of Nucleotides
- 7.3 DNA Contains the "Recipes" for a Cell's Proteins
- 7.4 Transcription Uses a DNA Template to Build RNA
- 7.5 Translation Builds the Protein
- 7.6 Cells Regulate Gene Expression
- 7.7 Mutations Change DNA Sequences
- 7.8 Investigating Life: Clues to the Origin of Language

#### SURVEY THE LANDSCAPE

##### DNA, Inheritance, and Biotechnology

DNA is an information storage molecule; its main function is to carry the "recipes" for the proteins that carry out the cell's work. Mutations in DNA ultimately generate all genetic variation.

For more details, study the Pull It Together feature at the end of the chapter.

**The Learning Outline introduces the chapter's main headings and helps students keep the big picture in mind.**

Each heading is a complete sentence that summarizes the most important idea of the section.

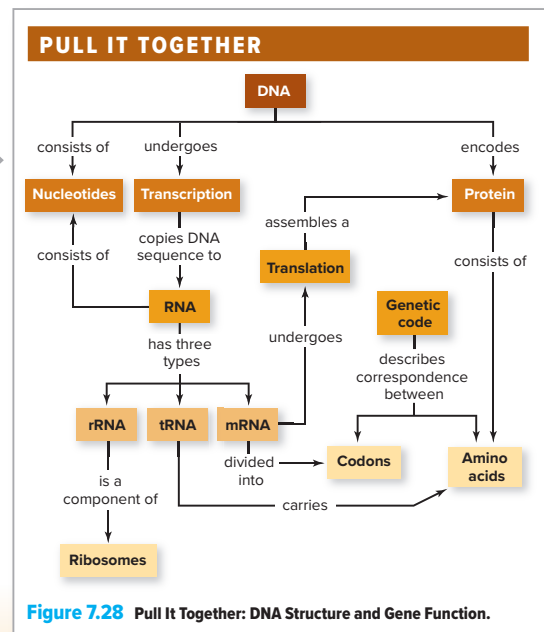

The gradual change in leaf colors as a chapter unfolds indicates where the student is in the chapter's big picture.

Students can also flip to the end of the chapter before starting to read; the chapter summary and Pull It Together concept map can serve as a review or provide a preview of what's to come.

**Concept maps help students see the big picture.**

Survey the Landscape concept maps at the start of each chapter illustrate how the pieces of the entire unit fit together. These new figures integrate with the existing Pull It Together concept maps in the chapter summary.

After spending class time discussing the key points in constructing concept maps, I have my students draw concept maps of their own.

**Figure 7.28** Pull It Together: DNA Structure and Gene Function.

## Learn How to Learn study tips help students develop their study skills.

Each chapter has one Learn How to Learn study tip, and a complete list is in Appendix F.

I present a *Study Minute* in class each week, with examples of how to use these study tips.

#### LEARN HOW TO LEARN

##### Pause at the Checkpoints

As you read, get out a piece of paper and see if you can answer the Figure It Out and Mastering Concepts questions. If not, you may want to study a bit more before you move on. Each section builds on the material that came before, and mastering one chunk at a time will make it much easier to learn whatever comes next.

## Investigating Life describes a real experiment focusing on an evolutionary topic related to each chapter's content.

Each Investigating Life section concludes with critical thinking questions that can be used as an in-class group activity. The studies touch on concepts found in other units; you can encourage students to draw a concept map illustrating the relationships between ideas. You might also use the experiment as a basis for discussion of the nature of science.

Connect interactive and test bank questions focus on the Investigating Life studies. Questions assess students' understanding of the science behind the Investigating Life experiment and their ability to integrate those concepts with information from other units.

## The Chapter Summary highlights key points and terminology from the chapter.

### INVESTIGATING LIFE

#### 7.8 Clues to the Origin of Language

As you chat with your friends and study for your classes, you may take language for granted. Although communication is not unique to humans, a complex spoken language does set us apart from other organisms. Every human society has language. Without it, people could not transmit information from one generation to the next, so culture could not develop. Its importance to human evolutionary history is therefore incomparable. But how and when did such a crucial adaptation arise?

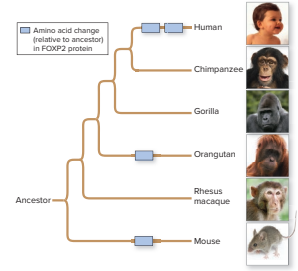

One clue emerged in the early 1990s when scientists described a family with a high incidence of an unusual language disorder. Affected family members had difficulty controlling the movements of their mouth and face, so they could not pronounce sounds properly. They also had lower intelligence compared with unaffected individuals, and they had trouble applying simple rules of grammar.

Researchers traced the language disorder to one mutation in a single gene on chromosome 7. Further research revealed that the gene belongs to the large *FOX* family of genes, abbreviated *FOX*. All members of the *FOX* family encode transcription factors, proteins that bind to DNA and control gene expression. The "language gene" on chromosome 7, eventually named *FOXP2*, encodes a transcription factor that affects both muscle control and the brain.

To learn more about the evolution of *FOXP2*, scientists Wolfgang Enard, Svante Pääbo, and colleagues at Germany's Max Planck Institute and at the University of Oxford compared the sequences of the 715 amino acids that make up the *FOXP2* protein in humans, several other primates, and mice (figure 7.24). In the 70 million or so years since the mouse and primate lineages split, the *FOXP2* protein has seldom changed. A mutation in the mouse *FOXP2* gene changed one amino acid; a different amino acid changed in orangutans. Yet, after humans split from chimpanzees—an event that occurred just 5 or 6 million years ago—the *FOXP2* protein changed twice.

Initially, the new, human-specific *FOXP2* version would have been rare, as are all mutations. Today, however, nearly everyone has the same allele of *FOXP2*. The human-specific *FOXP2* allele evidently conferred such improved language skills that individuals with the allele consistently produced more offspring than those without it. That is, natural selection "fixed" the new, beneficial allele in the growing human population.

A subsequent study revealed that Neandertal DNA contains the same two changes as those observed in modern humans. The mutations therefore must have occurred before modern humans and Neandertals split from their last common ancestor, some 300,000 to 400,000 years ago. The presence of the human-specific *FOXP2* protein in Neandertals, however, does not tell the whole story. Researchers have found an additional mutation in a noncoding region (intron) of *FOXP2* that is unique to

**Figure 7.24** *FOXP2* Protein Compared. This evolutionary tree shows how the 715 amino acids of the *FOXP2* protein differ in mice and various primates. Each blue box represents a difference of one amino acid. Photos: (Human) Arthur Tilley/Stockbyte/Getty Images; (chimp) Darryl Estrine/Getty Images; (gorilla) Emu/Shutterstock; (orangutan) Getty Images; (macaque) Jodi Mowlem/Flickr/Getty Images; (mouse) imageBROKER/Supershot

present-day humans. The absence of this mutation in Neandertal DNA may explain differences in human and Neandertal ability to communicate.

The study of *FOXP2* is important because it helps us understand a critical period in human history, the time individuals with the new, advantageous allele had higher reproductive fitness than those with any other version. The new allele therefore quickly became fixed in the human population. Without those events, human communication and culture (including everything you chat about with your friends) might never have happened.

#### 7.8 MASTERING CONCEPTS

1. What question about the *FOXP2* gene were the researchers trying to answer?
2. What could scientists learn by mutating the *FOXP2* gene in a developing human? Would such an experiment be ethical?

### CHAPTER SUMMARY

#### 7.1 Experiments Identified the Genetic Material

- A. Bacteria Can Transfer Genetic Information**
- Frederick Griffith determined that an unknown substance transmits a disease-causing trait between two types of bacteria.
  - With the help of proteins and DNA-destroying enzymes, scientists subsequently showed that Griffith's "transforming principle" was DNA.
- B. Hershey and Chase Confirmed the Genetic Role of DNA**
- Using viruses that infect bacteria, Alfred Hershey and Martha Chase confirmed that the genetic material is DNA and not protein.

#### 7.2 DNA Is a Double Helix of Nucleotides

- Erwin Chargaff discovered that A and T occur in equal proportions in DNA, as do G and C. Maurice Wilkins and Rosalind Franklin provided X-ray diffraction data. James Watson and Francis Crick combined these clues to propose the double-helix structure of DNA.
- DNA is made of building blocks called **nucleotides**. The rungs of the DNA "ladder" consist of **complementary** base pairs (A with T, and C with G). Hydrogen bonds hold the two strands together.
- The two chains of the DNA double helix are antiparallel, with the 3' end of one strand aligned with the 5' end of the complementary strand.

#### 7.3 DNA Contains the "Recipes" for a Cell's Proteins

- An organism's **genome** includes all of its genetic material. In eukaryotic cells, the genome is divided among multiple **chromosomes** (discrete packages of DNA and associated proteins).

#### A. Protein Production Requires Transcription and Translation

- A **gene** is a sequence of DNA that is transcribed to **RNA**, typically encoding a protein. To produce a protein, a cell **transcribes** a gene's information to mRNA, which is **translated** into a sequence of amino acids (table 7.3 and figure 7.25).

#### B. RNA Is an Intermediary between DNA and a Protein

- Three types of RNA (**mRNA**, **rRNA**, and **tRNA**) participate in gene expression (figure 7.26).

#### 7.4 Transcription Uses a DNA Template to Build RNA

##### A. Transcription Occurs in Three Steps

- Transcription begins when the RNA **polymerase** enzyme binds to a **promoter** sequence on the DNA **template strand**. RNA polymerase then builds an RNA molecule. Transcription ends when RNA polymerase reaches a **terminator** sequence in the DNA.

**TABLE 7.3** Merglonsary: Gene Expression

Term	Definition
Transcription	Production of RNA, using DNA as a template
Translation	Assembly of an amino acid chain (protein) according to the sequence of nucleotides in mRNA
Template strand	The DNA strand that is transcribed
Codon	A three-nucleotide mRNA sequence that encodes one amino acid or a "stop translation" signal
Genetic code	The "dictionary" that relates each codon with an amino acid or a stop signal

**Figure 7.25** Protein Production: A Summary.

#### B. mRNA Is Altered in the Nucleus of Eukaryotic Cells

- After transcription, the cell adds a cap and a poly A tail to mRNA.
- **Introns** are cut out of RNA, and the remaining **exons** are spliced together. The finished mRNA molecule then leaves the nucleus.

#### 7.5 Translation Builds the Protein

##### A. The Genetic Code Links mRNA to Protein

- Each group of three consecutive mRNA bases is a **codon** that specifies one amino acid (or signals translation to stop). The correspondence between codons and amino acids is the **genetic code**.

##### B. Translation Requires mRNA, tRNA, and Ribosomes

- mRNA carries a protein-encoding gene's information. tRNA associates with proteins to form **ribosomes**, which support and help catalyze protein synthesis.
- Each type of tRNA has an end with an **anticodon** complementary to one mRNA codon; the other end of the tRNA carries the corresponding amino acid.

##### C. Translation Occurs in Three Steps

- The stages of translation are initiation, elongation, and termination.
- In initiation, mRNA joins with a small ribosomal subunit and a tRNA carrying an amino acid. A large ribosomal subunit then joins the small one.

## Apply It Now boxes reinforce the applications of specific topics to the real world.

### 7.1 / Apply It Now

#### Some Poisons Disrupt Protein Production

Apply It Now 6.1 described several poisons that kill cells by interfering with respiration. Here we list a few poisons that inhibit transcription or translation; a cell that cannot make proteins quickly dies.

- **Amanitin:** This toxin occurs in the "death cap mushroom," *Amanita phalloides*. Amanitin inhibits RNA polymerase, making transcription impossible.
- **Diphtheria toxin:** Certain bacteria secrete a toxin that causes the respiratory illness diphtheria. This toxic compound inhibits an elongation factor, a protein that helps add amino acids to a polypeptide chain during translation.
- **Antibiotics:** Drugs that bind to bacterial ribosomes include clindamycin, chloramphenicol, tetracyclines, and gentamicin. When its ribosomes are disrupted, a cell cannot make proteins, and it dies.
- **Ricin:** Derived from seeds of the castor bean plant, ricin is a potent natural poison that consists of two parts. One part binds

to a cell, and the other enters the cell and inhibits protein synthesis by an unknown mechanism. Interestingly, the part of the molecule that enters the cell is apparently more toxic to cancer cells than to normal cells, making ricin a potential cancer treatment.

- **Trichothecenes:** Fungi in the genus *Fusarium* produce toxins called trichothecenes. During World War II, thousands of people died after eating bread made from moldy wheat, and many researchers believe trichothecenes were used as biological weapons during the Vietnam War. The mode of action is unclear, but the toxins seem to interfere somehow with ribosomes.

Jacana/Science Source

**7.1 Burning Question**

Do genes determine sexual orientation?

MOLEKUL/SP/Upa fotostock

Despite periodic headlines about newly discovered “gay genes,” scientists have not discovered a simple relationship between DNA and sexual orientation.

Research linking human behavior to individual genes is extremely difficult for several reasons. First, to establish a clear link to DNA, a researcher must be able to define and measure a behavior. This in itself is difficult because the spectrum of human sexual behavior does not necessarily conform to tidy boundaries. Second, multiple genes are likely to be involved. Third, epigenetic factors may affect gene expression: An individual who inherits a gene version associated with a trait will not necessarily express the gene if it remains “off.” To complicate matters, combinations of environmental cues that are unique to each individual may also influence gene expression.

Nevertheless, research has yielded some evidence of a role for genes in determining sexual orientation, at least in males. For example, an identical twin of a gay male is much more likely to also be gay than is a nonidentical twin, indicating a strong genetic contribution. In addition, some experiments have uncovered tantalizing genetic correlations: Researchers have found that some gene versions that are often present in gay males may also increase fertility in their mothers, and other studies have revealed distinctive patterns of gene activation in some gay males (see DNA availability in section 7.6B). Overall, however, clear cause-and-effect relationships remain elusive.

In addition to genes, the womb environment may also be associated with a male’s sexual orientation. The more older brothers a male has, the more likely he is to be gay. This “birth order” effect occurs only for siblings with the same biological mother; having older stepbrothers does not increase the chance that a male is gay. That means that events before birth (such as changes in the womb during previous pregnancies) are responsible for the effect.

While understanding the influences on sexual orientation may be interesting, its broader relevance to society remains controversial. Does this research simply further support the well-established conclusion that sexual orientation is not a choice, leading to broader acceptance of all people? Or does it unintentionally reinforce bigotry by casting less-common sexual orientations as “disorders”?

To summarize the answer to this Burning Question, research does suggest a genetic contribution to sexual orientation. Sorting out the complex interactions between multiple genes and the environment, however, remains a formidable challenge.

Submit your burning question to  
[MarieL.Hoefnagels@mheducation.com](mailto:MarieL.Hoefnagels@mheducation.com)

**mRNA Exit from Nucleus** For a protein to be produced, mRNA must leave the nucleus and attach to a ribosome (figure 7.18, part 4). If the mRNA fails to leave, the gene is silenced.

**mRNA Degradation** Not all mRNA molecules are equally stable. Some are rapidly destroyed, perhaps before they can be translated, whereas others persist long enough to be translated many times (figure 7.18, part 5).

Moreover, tiny RNA sequences called microRNAs can play a role in regulating gene expression. Each microRNA is only about 21 to 23 nucleotides long, and it does not encode a protein. Instead, a cell may produce a microRNA that is complementary to a coding mRNA. If the microRNA attaches to the mRNA, the resulting double-stranded RNA cannot be translated at a ribosome and is likely to be destroyed. Medical researchers are actively studying microRNAs; the ability to silence harmful genes may help treat illnesses ranging from cancer to influenza and HIV.

**Protein Processing and Degradation** Some proteins must be altered before they become functional (figure 7.18, part 6). Dozens of modifications are possible, including the addition of sugars or an alteration in the protein’s structure. Producing insulin, for example, requires a precursor protein to be cut in two places. If these modifications fail to occur, the insulin protein cannot function.

In addition, to do its job, a protein must move from the ribosome to where the cell needs it. For example, a protein secreted in milk must be escorted to the Golgi apparatus and be packaged for export (see figure 3.13). A gene is effectively silenced if its product never moves to the correct destination.

Finally, like RNA, not all proteins are equally stable. Some are degraded shortly after they form, whereas others persist longer.

A human cell may express hundreds to thousands of genes at once. Unraveling the complex regulatory mechanisms that control the expression of each gene is an enormous challenge. Biologists now have the technology to begin navigating this regulatory maze. The work has just begun, but the payoff will be a much better understanding of cell biology, along with many new medical applications. The same research may also help scientists understand how external influences on gene expression contribute to complex traits, such as the one described in Burning Question 7.1.

**7.6 MASTERING CONCEPTS**

1. What are some reasons that cells regulate gene expression?
2. How does a repressor protein help regulate the expression of a bacterial operon?
3. Explain how epigenetic modifications change the likelihood of transcription.
4. How do enhancers and transcription factors interact to regulate gene expression?

## Write It Out and Mastering Concepts questions are useful for student review or as short in-class writing assignments.

I compile them into a list of *Practice Questions* that help students focus on material I cover in class. I also use them as discussion questions in Action Centers, where students can come for additional help with course material.

## Figure It Out questions reinforce chapter concepts and typically have numeric answers (supporting student math skills).

Students can work on these in small groups, in class, or in Action Center. Most could easily be used as clicker questions as well.

**7.4 Figure It Out**

Suppose that a substitution mutation replaces the first A in the following mRNA sequence with a U:

5'-AAAGCAGUACUA-3'.

How many amino acids will be in the polypeptide chain?

Answer: Zero

## Burning Questions cover topics that students wonder about.

I ask my students to write down a Burning Question on the first day of class. I answer all of them during the semester, whenever a relevant topic comes up in class.

## Scientific Literacy questions reveal why biology matters to everyone.

These new thought questions at the end of each chapter encourage students to integrate biology with social, political, and ethical issues. They make great discussion and homework questions.

**SCIENTIFIC LITERACY**

Since 2018, the DNA-testing company 23andMe has allowed the drug company GlaxoSmithKline to access the vast amounts of genetic information in 23andMe’s databases. Use the Internet to learn more about the partnership between these companies. How might their arrangement benefit human health? What are some potential ethical concerns?

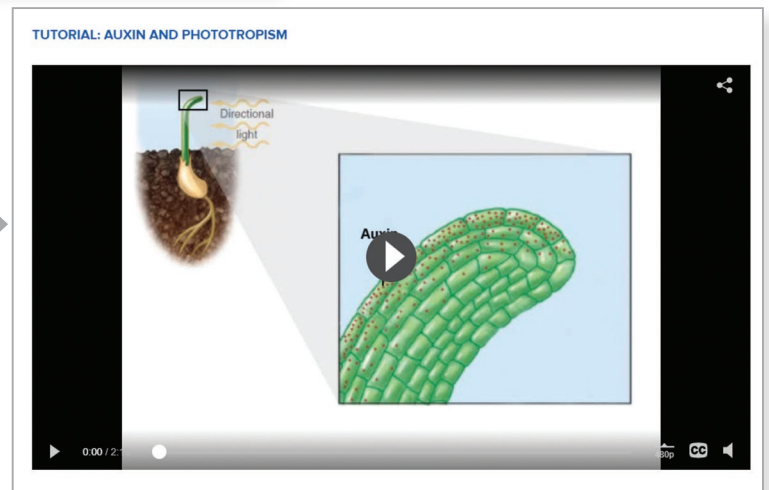

# Author's Guide *to Digital-Only Content*

Videos embedded in the ebook narrative bring relevance, clarity, and motion to difficult concepts.

Live-action and time-lapse videos integrated within the narrative show textbook concepts at work in the real world.

Animated tutorials guide students through complicated topics, using illustrations and examples from the book.

Answers to all chapter questions are found at the end of the question stem within the ebook.

**24.6 MASTERING CONCEPTS**

1. How do statoliths and auxins participate in gravitropism? [\[A\]](#)
2. How does thigmotropism help some plants climb? [\[A\]](#)

**Answer Mastering Concepts 24.6:**  
Thigmotropism is a response to touch in a specialized structure such as a tendril. Hormones cause differential growth in the tendril, allowing it to encircle physical supports such as a trellis or the branches of another plant.

Digital-only tables, miniglossaries, and figures expand on content from the print textbook.

Digital-only tables and miniglossaries help students organize new information and serve as helpful study tools.

New digital-only figures focus extra attention on topics not illustrated in the print text. In addition, some print figures have been reformatted for better display on mobile devices.

**DIGITAL EDITION PLANT TROPISMS: A SUMMARY**

Type	Stimulus	Response	Example
Phototropism	Light	Photoreceptors absorb light energy; auxins move to shaded side of stem and stimulate cell elongation.	Stem bends toward window.
Gravitropism	Gravity	Starch-rich statoliths “sink” within root cap cells; auxins cause root to bend downward (hypothesized mechanism).	Roots grow downward into soil.
Thigmotropism	Touch	Unknown	Tendril coils around trellis.

*every step*

## FOR STUDENTS

### Effective, efficient studying.

Connect helps you be more productive with your study time and get better grades using tools like SmartBook 2.0, which highlights key concepts and creates a personalized study plan. Connect sets you up for success, so you walk into class with confidence and walk out with better grades.

### Study anytime, anywhere.

Download the free ReadAnywhere app and access your online eBook or SmartBook 2.0 assignments when it's convenient, even if you're offline. And since the app automatically syncs with your eBook and SmartBook 2.0 assignments in Connect, all of your work is available every time you open it. Find out more at [www.mheducation.com/readanywhere](http://www.mheducation.com/readanywhere)

*"I really liked this app—it made it easy to study when you don't have your textbook in front of you."*

- Jordan Cunningham,  
Eastern Washington University

### No surprises.

The Connect Calendar and Reports tools keep you on track with the work you need to get done and your assignment scores. Life gets busy; Connect tools help you keep learning through it all.

### Learning for everyone.

McGraw-Hill works directly with Accessibility Services Departments and faculty to meet the learning needs of all students. Please contact your Accessibility Services office and ask them to email [accessibility@mheducation.com](mailto:accessibility@mheducation.com), or visit [www.mheducation.com/about/accessibility](http://www.mheducation.com/about/accessibility) for more information.

# Acknowledgments

It takes an army of people to make a textbook, and while I don't work with everyone directly, I greatly appreciate the contributions of each person who makes it possible.

As he has done for nearly a decade, Matt Taylor has worked alongside me at every stage, from first draft to finished product; in addition, he has seamlessly integrated the book's approach into our digital assets. His careful work and insights are invaluable.

I appreciate the help of my colleagues at The University of Oklahoma, including Dr. Doug Gaffin, Dr. Liz Karr, Dr. Andreeana Prichard, Dr. Ingo Schlupp, and Erin Simpson. Helpful colleagues from other institutions include Dr. Tom Curtis and Dr. Ruth Phillips. In addition, conversations with students in my classes spark many good ideas.

My team at McGraw-Hill is wonderful. Thank you to Michelle Vogler and Andrew Urban, who help us create the best book and digital resources possible. Anne Winch retains her amazing ability to juggle an ever-increasing slate of tasks, all

while remaining both responsive and funny. Jim Connelly and Britney Ross contribute energy and great ideas to the marketing side. Emily Tietz continues to provide outstanding service in photo selections. I also appreciate Angie Fitzpatrick and Vicki Krug for their impressive skills at the interface between us and the production team. Also among the talented folks at McGraw-Hill are David Hash, Melissa Homer, Rachael Hillebrand, Janie Larsen, and Jane Peden, who have made life easier in countless ways. Thanks to all of you for all you do.

My family and friends continue to encourage me. Thank you to my parents and sister for their pride and support. I also thank my friends Ben and Angie Holt, Michael Markham and Kristi Isachsen, J. P. Masly and Heidi Mueller, Karen and Bruce Renfroe, and Ingo and Andrea Schlupp. Cats Smudge and Snorkels are worthy companions in my office as well. Finally, my husband, Doug Gaffin, is always there for me, helping in countless large and small ways. I could not do this work without him.

I am grateful to the reviewers who offered detailed feedback and valuable suggestions for improvement of the fifth edition.

# Changes by Chapter

## UNIT 1 Science, Chemistry, and Cells

- **Chapter 1 (The Scientific Study of Life):** Added connections between *enzymes*, *respiration*, and *photosynthesis* to all Survey the Landscape illustrations in unit 1; changed *producers* to *primary producers* throughout narrative and art to improve consistency with other chapters; added a paragraph explaining figure 1.8; clarified common ancestry of animals and fungi in figure 1.9 and derivative figures throughout the book; introduced the idea of eukaryotic “supergroups” in section 1.2; revised paragraph in section 1.3 describing topics that are off-limits for science; added *Design experiment* to figure 1.10. Based on SmartBook user data, improved the explanation of the relationship between growth and development in section 1.1. Added a new learning tool to ebook: a miniglossary of reproduction and development in section 1.1.
- **Chapter 2 (The Chemistry of Life):** Added an explanation of electron cloud in section 2.1; revised section 2.3’s introductory paragraph to make it more relatable to readers; improved figure 2.15 to better highlight the positions of neutrality, acidity, and alkalinity; added brackets and reworked labels in figure 2.20 to clarify primary and secondary structures; added cell for context in figure 2.24; deleted information about trans fats in section 2.5 and Burning Question 2.2, as they are no longer allowed in processed foods; added to Burning Question 2.2 an explanation of why highly digestible junk foods contribute more calories than raw fruits and vegetables; in section 2.5, clarified that the animal body produces the cholesterol it needs; added to section 2.5 a passage about the functions of waxes in animals and plants; reworked Pull It Together to add hydrogen bonds and increase the number of connections. Added new learning tools to ebook: a table summarizing the characteristics of water and a video showing oil and water separation in section 2.3.
- **Chapter 3 (Cells):** Wrote a new chapter opener exploring the link between medical specimens and patient privacy; modified figure 3.6 to clarify the relationship between cytoplasm and its components; modified figures 3.8 and 3.9 to better depict ribosomes; rearranged figure 3.28 for more efficient arrangement and enhanced labeling; in section 3.6, added a paragraph about components of the cell wall that interfere with biofuels production; expanded figure 3.31 to include more information about prokaryotic and eukaryotic cells. Based on SmartBook user data, clarified in section 3.4 that some plastids store starch. Added a new learning tool to ebook: a miniglossary of features common to all cells in section 3.1.
- **Chapter 4 (The Energy of Life):** In chapter introduction, added specific suggestions for relating the parts to the whole in Learn How to Learn; reworked chapter opening essay to focus on hummingbirds, sloths, and ways we can to boost our own metabolic rate; in section 4.1, explained how light and sound have kinetic energy; reworked figure 4.9 to clarify the concept of coupled reactions and reworked the passage describing figure 4.9 to clarify that energy from the ATP hydrolysis reaction drives the endergonic reaction; reworked figure 4.10b to better integrate with other content from the chapter; added new Burning Question 4.1 on hibernation; added new figure 4.19 to illustrate how ATP synthase enzyme uses facilitated diffusion; added new Apply It Now 4.1 on hand sanitizers; clarified figure 4.24 to better illustrate vesicle recycling in electric fish. Based on SmartBook user data, clarified figure 4.7 to show that the endmost high-energy covalent bond breaks in ATP hydrolysis. Added a new learning tool to ebook: a video of a hummingbird in flight in the chapter opening essay.
- **Chapter 5 (Photosynthesis):** Wrote a new chapter opening essay about the mass of air; added details about previewing a chapter in Learn How to Learn; changed leaf photo in figure 5.5; in section 5.5, simplified the definition of carbon fixation and added information about the importance of the Calvin cycle; standardized depictions of the Calvin cycle throughout figure 5.11; reworked figure 5.13 and the Investigating Life essay for clarity; added *chlorophyll* and *other organic molecules* to figure 5.14. Based on SmartBook user data, clarified that the cellulose built with the products of photosynthesis is part of plant cell walls. Added new learning tools to ebook: a miniglossary of oxidation and reduction in photosynthesis in section 5.1; a miniglossary of leaf anatomy in section 5.2.
- **Chapter 6 (Respiration and Fermentation):** Wrote a new chapter opening essay about the controversy over high fructose corn syrup; clarified labels and caption in figure 6.1;

revised figure 6.10 for clarity; revised figure 6.11 to add inputs to and outputs of fermentation; updated Burning Question 6.1 to reflect changes in diet pill availability; replaced Figure It Out 6.2; revised figure 6.12 for clarity. Added new learning tools to ebook: a miniglossary of oxidation and reduction in cellular respiration in section 6.1; a table summarizing high-energy products of cellular respiration in section 6.6 (based on SmartBook user data).

## UNIT 2 DNA, Inheritance, and Biotechnology

- Chapter 7 (DNA Structure and Gene Function):** Throughout the chapter, replaced *protein synthesis* with *gene expression* as appropriate; wrote new chapter opening essay on the first use of DNA to solve a crime; in section 7.4, clarified that RNA polymerase both unzips and copies the DNA in transcription; in figure 7.10, clarified the position of RNA polymerase relative to the transcription bubble; added the untranslated region at the 5' end to figure 7.11 for consistency with figure 7.15; modified figure 7.15 to improve consistency with figure 7.11 and to clarify the relationship between the codon and the anticodon; in section 7.5, clarified how translation is initiated; updated Burning Question 7.1 to reflect current research; clarified wording in table 7.2 and added a row for deletion mutations that cause frameshifts; updated research in Investigating Life section. Based on SmartBook user data, clarified that eukaryotic chromosomes are linear; simplified the description of the roles of the cap and poly A tail. Added new learning tools to ebook: a table summarizing the stages of transcription; a table summarizing the stages of translation; a figure illustrating the DNA scale from nucleotide to chromosome.
- Chapter 8 (DNA Replication, Binary Fission, and Mitosis):** Reworked figure 8.2 to include more cell division functions; revised figure 8.4 for clarity; in section 8.4, reinforced that each replicated chromosome consists of two sister chromatids; revised Figure It Out 8.2 to reinforce that replication does not double the chromosome number; revised Burning Question 8.1 to answer whether plants get cancer; in section 8.6, added information about immunotherapy as a cancer treatment and connected the passage on cancer risk to Burning Question 16.1 (human papillomavirus); wrote new Investigating Life on adaptive cancer therapies. Based on SmartBook user data, added bold type and glossary definition for *RNA primer*; clarified that eukaryotic chromosomes are linear. Added a new learning tool to ebook: a figure illustrating the DNA scale from nucleotide to chromosome.
- Chapter 9 (Sexual Reproduction and Meiosis):** In section 9.2, clarified that sex chromosomes XX are *typical* of females and XY are *typical* of males; added that chromosomes have been replicated to figure 9.3's caption; made several changes to clarify the difference between homologous and replicated chromosomes; stated explicitly that DNA replication does

not make a cell diploid; emphasized that alleles typically differ only slightly, so homologous chromosome pairs likewise differ only slightly; clarified figure 9.4 to avoid the implication that offspring inherit chromosomes that are already replicated; added Mastering Concepts question to reinforce the changes to section 9.2; added two chromosomes to figure 9.6; revised Figure It Out 9.2 to include not only DNA content but also chromosome number; revised arrow colors in figure 9.11; in section 9.6, reminded readers that variation arising from meiosis and mutations is the foundation of evolutionary change; in section 9.7, explained the connection between misalignment in crossing over and errors in chromosome structure; reworked Apply It Now 9.1 to include conjoined twins and parasitic twins and to update information on incidence of multiple births; incorporated crossing over into figure 9.23; added questions at end of chapter to reinforce the difference between homologous and replicated chromosomes. Based on SmartBook user data, bold-faced *parental chromatid* and *recombinant chromatid* in section 9.5 and added both terms to figure 9.8 and to the digital-only miniglossary of variability in meiosis. Added new learning tools to ebook: a figure showing an analogy between homologous chromosomes and book editions; a figure illustrating the DNA scale from nucleotide to chromosome.

- Chapter 10 (Patterns of Inheritance):** In sections 10.1 and 10.7, clarified that sex chromosomes XX are *typical* of females and XY are *typical* of males; in the figure 10.1 caption, added a reminder of the relationship between homologous and replicated chromosomes; in section 10.2, clarified that mutations can be harmful, neutral, or beneficial; in section 10.4, modified the narrative and added to figure 10.12's caption to propose alternative hypotheses for the results of a dihybrid cross before revealing that Mendel observed independent assortment; labeled parental and recombinant chromatids in figure 10.15; in section 10.8, added achondroplasia as an example of a disorder caused by a mutation for which the encoded protein is overly active; in table 10.3, added rows for cancer-related autosomal dominant and autosomal recessive genes; in section 10.9, briefly described epigenetics and explained why identical twins become more different as they age; reworked figure 10.29 to incorporate a histogram showing the frequencies of each allele combination; connected dominant and recessive alleles to functional and nonfunctional proteins in Pull It Together; added a pedigree problem to the How to Solve a Genetics Problem section. Added new learning tools to ebook: a figure summarizing the names of the generations in genetics; a figure listing milestones in the history of genetics; a figure illustrating the DNA scale from nucleotide to chromosome.
- Chapter 11 (DNA Technology):** Wrote new chapter opening essay on the use of CRISPR-Cas9 in citrus trees; added photo to figure 11.1 to show the amount of DNA in a bacterial cell; reworked figure 11.2 to show the production

of insulin; in section 11.2, noted that plasmids occur naturally in bacteria and yeasts, added golden rice as an example of a transgenic plant, noted that transgenic farm animals can secrete human proteins in their milk, clarified that genetically modified foods have not been linked to health problems in humans, added information about high-throughput DNA technologies, added that transposons can cause problems in genes where they land, and clarified that trained technicians rarely contaminate PCR reaction tubes; clarified figure 11.8; updated data in figure 11.9; added CRISPR-Cas9 to Burning Question 11.1; reworked figure 11.13 for clarity and improved layout; in section 11.3, added monkeys to the list of cloned mammals; added subheading and new figure 11.17 to explain CRISPR-Cas9; in Apply It Now 11.1, added CRISPR-Cas9 as a new way of doping. Added a new learning tool to ebook: a figure illustrating the DNA scale from nucleotide to chromosome.

### UNIT 3 The Evolution of Life

- **Chapter 12 (The Forces of Evolutionary Change):** Added *genetic variation* to all Survey the Landscape illustrations in unit 3; in the chapter opening essay, added information about preventing the spread of antibiotic-resistant bacteria; reworked figure 12.5 to add artificial selection for dog breeds; revised Apply It Now 12.1 to focus on dog evolutionary history and to clarify why purebred dogs have health problems; in section 12.2C, added a paragraph explaining the connection between natural selection and long-term evolutionary processes; added description and photo of porcupinefish to illustrate adaptations; in section 12.3, added table with selected misconceptions about evolution; added illustration to Burning Question 12.1 to compare inaccurate and accurate depictions of human evolution; added an intermediate habitat to figure 12.14a. Based on SmartBook user data, clarified in section 12.7 that migration tends to reduce genetic differences between populations.
- **Chapter 13 (Evidence of Evolution):** Clarified figure 13.2 for consistency with chapter 15 and to add a footnote about the Anthropocene; in section 13.2B, added a paragraph connecting the word *Phanerozoic* and the abundance of fossil evidence from that time; clarified Figure It Out 13.1; in section 13.6, added a sentence to emphasize the advantage of molecular data over other forms of evidence for evolution; in section 13.6, connected the passage on gene duplication to section 9.7B. Based on SmartBook user data, revised passage on marsupials in section 13.3.
- **Chapter 14 (Speciation and Extinction):** Reworked parts of the chapter opening essay to focus on Socotra (to match the accompanying photo) and to better foreshadow the contents of the chapter; clarified that the ladybugs in figure 14.4 are herbivorous; added labels to figure 14.8 and clarified the description of the little greenbuls from the forest and ecotone; reworked figure 14.9 and the accompanying

narrative to better show the difference between the cichlids; in section 14.4, described bryozoans to clarify why they have an extensive fossil record; added a description of the adaptive radiation of mammals illustrated in figure 14.13; in section 14.5, added a new subheading explaining why today's biodiversity crisis matters; reworked figure 14.15 to better show the nested taxonomic hierarchy; added Figure It Out 14.2 to help readers articulate common ancestry.

- **Chapter 15 (The Origin and History of Life):** Wrote new chapter opening essay about the biological meaning of *race*; revised section 15.1 to accommodate the possibility of dozens of types of amino acids; in section 15.2, revised passage and illustration on endosymbiosis to include proteobacteria; in section 15.3, added brief descriptions of some unfamiliar groups of organisms, including bryozoans; in section 15.3, replaced the outdated Tertiary Period with the Paleogene and Neogene Periods and corrected the start of the Quaternary Period; added *hominoid* to table 15.1; in section 15.4, added *Homo naledi* to the list of *Homo* species, mentioned the Denisovans, clarified the passage on interbreeding with Neandertals, clarified the passage on the emergence of bipedalism, added folate to the passage on skin pigment, offered a more explicit link to Investigating Life 25.6, and added an explanation of the proposed Anthropocene epoch. Added new learning tools to ebook: three videos depicting primates in section 15.4A.

### UNIT 4 The Diversity of Life

- **Chapter 16 (Viruses):** Added receptors to entire cell surface in figure 16.3; in section 16.4, added *virulence* as a bold-faced term and explained that high virulence does not always mean high fitness; in section 16.4, improved explanation of HIV attachment to T cell; updated Burning Question 16.1 on cancer-causing human papillomavirus; added new figure to Apply It Now 16.1 to illustrate how anti-HIV drugs work. Added a new learning tool to ebook: a table listing viruses that infect humans.
- **Chapter 17 (Bacteria and Archaea):** In chapter opening essay, noted that biofilms can degrade diesel fuel; in section 17.2, added information about the composition of the archaean cell wall to narrative and figure 17.2; added inset for ribosomes to figure 17.3; in section 17.2, explained why gram-positive cells retain violet dye; added mechanisms of antibiotic resistance to Apply It Now 17.1; rearranged figure 17.8 and added icons for aerobic and anaerobic environments; added *Helicobacter pylori* to table 17.1; in section 17.3, improved consistency between bacterial descriptions and section 15.2; in section 17.3, explained why producing antibiotics is adaptive for soil bacteria and updated information on archaean superphyla; updated information about gene function in Focus on Model Organisms 17.1; in section 17.4, added the term *microbiome* to connect microbiology with current news, bold-faced the term

*virulence*, and clarified the difference between exotoxins and endotoxins; in section 17.5, added a sentence about low-tech solutions to the spread of antibiotic-resistance genes. Based on SmartBook user data, clarified that chemotrophs derive energy from oxidizing chemicals in section 17.2. Added a new learning tool to ebook: a miniglossary of prokaryote diversity in section 17.2.

- **Chapter 18 (Protists):** Updated chapter opening essay to reflect recent research on *Pfiesteria*; revised section 18.1 to consider updated information about eukaryotic supergroups; in section 18.2, emphasized the enormous scale of the aquatic habitats occupied by algae; added information about toxins to Burning Question 18.1; in section 18.2, connected *Chlamydomonas* and *Volvox* to the evolution of multicellularity in section 15.2; updated information about eukaryotic supergroups in section 18.5 and table 18.1. Added new learning tools to ebook: videos showing *Euglena* and *Volvox* in section 18.2; a video showing *Paramecium* and a miniglossary of protozoa in section 18.4.
- **Chapter 19 (Plants):** In section 19.1, emphasized that cyanobacteria and algae were the first to release O<sub>2</sub>; reworked figure 19.11 to show that fern gametophytes typically cross-fertilize; updated Focus on Model Organisms 19.1. Added new learning tools to ebook: a table summarizing bryophyte characteristics in section 19.2; a table summarizing seedless vascular plant characteristics in section 19.3; a table summarizing gymnosperm characteristics in section 19.4; a table summarizing angiosperm characteristics in section 19.5; in the chapter summary, a figure showing highlights in the history of plants and a table summarizing plant adaptations.
- **Chapter 20 (Fungi):** Updated the chapter opening essay with additional uses for fungi; modified figure 20.3 to show feeding at hyphal tips; connected step numbers in figure 20.16 to the narrative and modified the caption to highlight the roles of mitotic division and meiosis; in section 20.7, improved explanation of materials exchange in a mycorrhiza; improved figure 20.20 to show exchange of materials between a lichen's partners; added a miniglossary of fungal anatomy and reproduction (previously a digital-only feature) to the print edition. Added new learning tools to ebook: a time-lapse video showing mushroom growth in the chapter opening essay; a table summarizing chytrid characteristics in section 20.2; a table summarizing zygomycete characteristics in section 20.3; a table summarizing glomeromycete characteristics in section 20.4; a table summarizing ascomycete characteristics in section 20.5; a time-lapse video of moldy food with Burning Question 20.1; a table summarizing basidiomycete characteristics in section 20.6; a video showing leaf-cutter ants and a figure comparing the anatomy of arbuscular mycorrhizae and ectomycorrhizae in section 20.7.
- **Chapter 21 (Animals):** Improved the layout of figure 21.8; in section 21.2, added information about commercial sponges harvesting; in section 21.8, added information about insect abundance and diversity; in section 21.9,

clarified that echinoderms have a type of radial symmetry called *pentamerism*; in section 21.11, clarified information about tunicates; added tuataras to figure 21.38; updated information in Apply It Now 21.3. Added new learning tools to ebook: 13 videos to help students visualize the diversity in the animal kingdom; a table summarizing sponge characteristics in section 21.2; a table summarizing cnidarian characteristics in section 21.3; a table summarizing flatworm characteristics in section 21.4; a table summarizing mollusk characteristics in section 21.5; a table summarizing annelid characteristics in section 21.6; a table summarizing roundworm characteristics in section 21.7; a figure showing monarch butterfly metamorphosis and a table summarizing arthropod characteristics in section 21.8; a table summarizing echinoderm characteristics in section 21.9; a table summarizing chordate characteristics in section 21.10; a table summarizing tunicate and lancelet characteristics in section 21.11; tables summarizing hagfish and lamprey characteristics in section 21.12; a table summarizing fish characteristics in section 21.13; a table summarizing amphibian characteristics in section 21.14; a table summarizing reptile characteristics in section 21.15; a table summarizing mammal characteristics in section 21.16; a figure showing highlights in the history of animals in the chapter summary.

## UNIT 5 Plant Life

- **Chapter 22 (Plant Form and Function):** In the chapter opening essay, mentioned that coca leaf chewing is part of everyday life in the Andes; in section 22.1, added introductory paragraph explaining why this unit focuses on angiosperms, noted that some tendrils are derived from leaves, and improved the descriptions of the photos in figure 22.3; in section 22.2, added hormones to the list of substances carried in xylem and phloem; rearranged section 22.2 and improved table 22.2 to reduce confusion between cell types and tissue systems; in section 22.3, added stipules to narrative and figure 22.10, along with an inset to show the axillary bud and stipules; added labels for upper and lower cuticles in figure 22.12; clarified labels in figure 22.17; in section 22.5, added information about potential benefits of domatia; in chapter summary, clarified description of collenchyma.
- **Chapter 23 (Plant Nutrition and Transport):** Updated Apply It Now 23.1 to expand on the pros and cons of different forms of fertilizer; in section 23.2, added hormones to contents of xylem sap, added mycorrhizae to the passage on root hairs in the description of figure 23.7, and added adhesion to passage on cohesion–tension theory; in section 23.3, noted that the cells that make up sieve tubes are alive; in section 23.4, reworked and clarified the passage on parasitic plants. Added a new learning tool to ebook: a video of a Venus flytrap in the chapter opening essay.

- **Chapter 24 (Reproduction and Development of Flowering Plants):** Reworked the chapter opening essay to focus more on wild bees; in section 24.1, set the context for the chapter's focus on angiosperms by reminding readers of other plant groups; added a picture of a rooted cutting to figure 24.1; in section 24.2, improved the description of coevolution, added descriptive part labels to figure 24.7, and improved the explanation of the cotyledons' role in monocot and eudicot seeds; in section 24.3, clarified the descriptions of seed germination and early seedling growth; in section 24.4, clarified the descriptions of some hormones; in Apply It Now 24.1, explained why knowing about plant defenses could be useful; in section 24.5, added that cryptochrome is sensitive to blue light and clarified the adaptive value of phytochrome's role in seed germination. Added new learning tools to ebook: a time-lapse video of germinating wheat seeds in section 24.3; a time-lapse video of phototropism in section 24.5; time-lapse videos of gravitropism and thigmotropism in section 24.6; a time-lapse video of growth from buds in section 24.7.
- UNIT 6 Animal Life**
- **Chapter 25 (Animal Tissues and Organ Systems):** Added *survival* and *reproductive success* to all Survey the Landscape illustrations in unit 6; in section 25.2, explained the role of stem cells in generating animal tissues; in section 25.2, introduced and explained the term *interstitial fluid* with the extracellular matrix; omitted the term *ground substance* from all references to the extracellular matrix; referred to anchoring junctions in passage about the extracellular matrix; clarified the difference between the basement membrane and a cell's plasma membrane; wrote new Apply It Now 25.1 on organ system interactions in food poisoning; added *sensors*, *control center*, and *effector* to figure 25.10 and its caption and added *control center* to corresponding narrative. Added new learning tools to ebook: a video of an athlete with a prosthetic limb in the chapter opening essay; a miniglossary of animal tissues in section 25.2; a miniglossary of negative feedback in section 25.4.
  - **Chapter 26 (The Nervous System):** Improved depiction of planarian brain in figure 26.2; in section 26.3, clarified that the resting potential reflects a balance of forces on multiple ions, including  $K^+$ ; in section 26.3, refined the distinction between graded potentials and action potentials and clarified that the passage connecting the two refers only to stimuli that provoke action potentials (not inhibitory stimuli); expanded figure 26.7 to better depict the analogy between action potential propagation and a chain of firecrackers; in section 26.3, clarified that the voltage-gated sodium channels at each node of Ranvier respond to depolarization at the previous node; improved depiction of saltatory conduction in figure 26.8; modified figure 26.14 to clarify the relationship between the brain's main areas and the brainstem; in section 26.6, combined two figures to show the cerebral cortex photo in the context of the corresponding art; expanded Apply It Now 26.1 to include GABA and additional information about serotonin. Added a new learning tool to ebook: a miniglossary of neuron anatomy in section 26.2.
  - **Chapter 27 (The Senses):** Wrote new chapter opening essay on distraction blindness; wrote new Burning Question 27.1 on scratching bug bites; corrected appearance of tectorial membrane in figure 27.13 and figure 27.18; in section 27.5, clarified that the semicircular canals detect rotation but not tilt; added paragraph on retinal implants in Apply It Now 27.1; added paragraph describing new technologies in hearing aids and cochlear implants in Apply it Now 27.2; in chapter ending, added a Write It Out question about why capsaicin feels hot. Added new learning tools to ebook: a miniglossary of smell and taste in section 27.3; expanded the miniglossary of the pathway of auditory information in section 27.5.
  - **Chapter 28 (The Endocrine System):** In the chapter opening essay, distinguished between an immediate fear response and a sustained hormonal response to stress; in section 28.2, clarified that steroid hormones may inhibit or stimulate gene expression; reworked Burning Question 28.1 to focus on BPA; modified figure 28.7 to include the role of the hypothalamus as a sensor; modified figure 28.10 to include the pancreas as a sensor; reworked graph in figure 28.12 to illustrate the association between obesity and type 2 diabetes. Added a new learning tool to ebook: a miniglossary of hormones and responses in section 28.2.
  - **Chapter 29 (The Skeletal and Muscular Systems):** Updated the chapter opening essay to incorporate new technologies in prosthetics; in section 29.3, clarified that bone marrow consists of tissue; added sensors to figure 29.9; replaced one micrograph in figure 29.15 with a more informative one; in section 29.4, clarified the paragraph describing the role of ATP in muscle contraction; in section 29.5, improved consistency between passage on fermentation and chapter 6; in Burning Question 29.2, added a paragraph about sports balm.
  - **Chapter 30 (The Circulatory System):** Wrote new chapter opening essay about childhood leukemia; in Burning Question 30.1, added information about treatment for bruises; in section 30.2, clarified the functions of blood plasma and explained its relationship with interstitial fluid, clarified the passage about leukemia, and clarified the description of platelet origin; in Burning Question 30.2, clarified that plasma is purified before use by pharmaceutical companies; in section 30.4, added a brief description of gap junctions and defined stroke volume; added sensors to figure 30.15; in section 30.6, clarified the relationship between lymph vessels and lymph capillaries; in section 30.7, added icefish circulatory system adaptations to strengthen the connection with chapter content. Added a new learning tool to ebook: a miniglossary of circulation in section 30.5.

- **Chapter 31 (The Respiratory System):** In section 31.2, removed the word *tubules* from the description of the respiratory system; in section 31.2, added a sentence explaining the role of surfactants in alveoli and clarified that the inner surface of each alveolus is coated with a thin film of water; in section 31.3, clarified that forceful exhalation requires muscle contraction; in Apply It Now 31.1, added e-cigarettes and nicotine gum/patches as potential aids to help stop smoking; in section 31.4, clarified paragraph explaining the interaction between iron, hemoglobin, red blood cells, and O<sub>2</sub>; in section 31.4, clarified the roles of CO<sub>2</sub> and blood pH in regulating the breathing rate; added hypoxic chambers and Diamox to Burning Question 31.1. Based on SmartBook user data, clarified what it means for the bicarbonate reactions to reverse at the lungs in section 31.4. Added a new learning tool to ebook: a miniglossary of the pathway of respiration in section 31.2.
- **Chapter 32 (Digestion and Nutrition):** Revised the chapter opening essay to include more information about probiotics; in section 32.2, explained intracellular digestion in a sponge collar cell and added a corresponding inset to figure 32.4a; clarified that the cecum is part of the large intestine in figure 32.6a; in section 32.3, clarified the role of peristalsis in mixing food with enzymes to form a liquid; in section 32.3, explained the role of the sphincter at the lower end of the esophagus and connected its function to heartburn; in section 32.3, defined *bowels* and added “producing cholesterol” to the list of liver functions; wrote new Burning Question 32.1 about vegan diets; added celiac disease, Crohn disease, and irritable bowel syndrome to Apply It Now 32.1; in section 32.4, updated illustration of nutrition label and clarified the distinction between calories and food Calories.
- **Chapter 33 (Regulation of Temperature and Body Fluids):** In section 33.1, clarified the distinction between ectothermy, endothermy, and heterothermy; added hibernation to the paragraph on heterothermy; in section 33.5, improved consistency of use of *salts* and *ions*; in section 33.5, added a sentence to explain aldosterone’s effects on the kidneys; added a paragraph about urine color as an indication of dehydration to Burning Question 33.1; in section 33.6, added a second, contrasting study and two new illustrations. Based on SmartBook user data, added a new learning tool to ebook: a table of thermoregulatory adaptations in section 33.1. Added two new videos to ebook: marine iguanas feeding underwater and basking in the chapter opening essay.
- **Chapter 34 (The Immune System):** In section 34.1, added *leukocytes* as an alternative name for white blood cells; in section 34.2A, clarified that inflammation can be a response to infection or allergy, not just minor injury; clarified innate defenses in figure 34.4; in section 34.3, defined clonal selection in the passage on T cell proliferation; wrote new Apply It Now 34.1 on medical applications of antibodies; in section 34.4, emphasized that most vaccines cannot cause disease and referred back to Burning Question 16.1; added a row for celiac disease to

table 34.4; in section 34.5, mentioned the role of basophils in allergic reactions, reinforced the role of histamine in allergies, and added information about “retraining” the immune system to accept allergens such as peanuts. Based on SmartBook user data, added information about why an Rh<sup>+</sup> woman’s immune system does not attack an Rh<sup>+</sup> fetus in section 34.5. Added a new learning tool to ebook: a miniglossary of adaptive immunity in section 34.3.

- **Chapter 35 (Animal Reproduction and Development):** Revised and updated the chapter opening essay; in section 35.1, explained the difference in size and motility between sperm and eggs; in section 35.2, reminded students that spermatogonia have 46 chromosomes and clarified why abuse of synthetic steroids reduces sperm counts; in section 35.3, clarified how an egg cell moves into and within the uterine tube and reminded readers that the secondary oocyte contains 23 chromosomes; revised Burning Question 35.1 and figure 35.A for clarity; in section 35.4, changed *STD* to *STI* to conform with modern terminology, noted the pregnancy rate for women who use no contraception, updated information on the HPV vaccine, and referred to Burning Question 16.1; in section 35.5, clarified the structure and function of the placenta and clarified some of the events of embryonic and fetal development; improved Apply It Now 35.1 to define infertility and mention that either males or females can be infertile; clarified the difference between miscarriage and stillbirth in Apply It Now 35.2; wrote new Investigating Life section 35.7 about sexual cannibalism in nursery web spiders. Based on SmartBook user data, referred readers in section 35.3 to the chapter summary to compare the timing of spermatogenesis and oogenesis. Added a new learning tool to ebook: a timeline of human development in section 35.5.

## UNIT 7 The Ecology of Life

- **Chapter 36 (Animal Behavior):** In section 36.1, added examples of everyday applications of animal behavior; in section 36.2, updated information about birds with human vocabularies; in section 36.4, added polyandry to the section describing polygamy and revised the passage on mate guarding; in section 36.5, clarified the distinction between *direct fitness* and *indirect fitness* and expanded the passage on altruism in humans. Added new learning tools to ebook: a video of a dung beetle in section 36.1; a video of blue-footed boobies courting in section 36.4; a video of a cuttlefish changing color in section 36.6.
- **Chapter 37 (Populations):** In section 37.1 and throughout the chapter, added conservation biology examples where space and flow permitted; in Apply It Now 37.1, added information on counting animals in the open ocean; in section 37.2, added examples of ways that conservation biologists can boost birth rates and reduce death rates, updated information about immigration in the United States and worldwide birth and death rates, added a paragraph explaining how human activities

promote the migration of invasive species to new areas, and added the designators “late loss,” “constant loss,” and “early loss” to type I, type II, and type III species in narrative and figure 37.5; in section 37.3, clarified why  $r$  is constant in exponential and logistic growth equations; updated information about the human population in section 37.5’s narrative, figure 37.12, figure 37.15, table 37.2, and Burning Question 37.1; in section 37.5, clarified the passage describing the demographic transition; in section 37.6, clarified how microbes form the base of the food web in a toxic stream; in the chapter ending, added new figure summarizing population growth rates. Based on SmartBook user data, modified figures 37.6 and 37.8 to better show how the tabulated numbers relate to one another. Added a new learning tool to ebook: a figure comparing opportunistic to equilibrium life histories.

- **Chapter 38 (Communities and Ecosystems):** In section 38.1, added the definition of *carnivore*, rearranged the section on prey defenses to start with the most familiar examples, and referred back to section 22.5 as another example of coevolution; in section 38.2, added that it took decades of scientific debate to determine that few communities reach climax conditions; modified figure 38.14 to point out that phytoplankton are primary producers and that krill eat detritus; in section 38.3, clarified explanation of keystone species and reminded readers that heat is exchanged with the environment and leaves the food web; in section 38.4, modified the illustrations of the carbon, nitrogen, and phosphorus cycles to indicate processes that are heavily influenced by human activities; added labels for denitrification to figure 38.21; in section 38.4, clarified the explanation of eutrophication; wrote new Investigating Life section on monarch butterfly migration; in chapter ending, added a new Scientific Literacy question asking students to explore how policy makers weigh both science and economics to make decisions. Added a new learning tool to ebook: a video of a chameleon catching a spider in section 38.1; a figure depicting otters as keystone species in section 38.3.
- **Chapter 39 (Biomes):** Wrote new chapter opening essay on life in caves; added a paragraph on oxygen isotopes in foram shells to Burning Question 39.1; added inset to figure 39.2 to explain the uneven distribution of sunlight over Earth’s surface; added lines for 60 N and 60 S to figure 39.7; in section 39.3, stated that the main selective forces in the rain forest are competition for light and nutrients and added information about soils in deciduous forests and tropical savannas; added descriptive labels to figure 39.23; wrote new Investigating Life about the economic impacts of climate change, especially on the timber industry. Based on SmartBook user data, clarified in section 39.3 that most temperate forests are in the northern hemisphere. Added new learning tools to ebook: a video of bats emerging from a cave in the chapter opening essay; a time-lapse video of a deciduous tree in section 39.3; a video of coral reef biodiversity in section 39.5.
- **Chapter 40 (Preserving Biodiversity):** Wrote new chapter opening essay on invasive lionfish; added new figure 40.3 to show where human impacts on the environment are most intense; in section 40.1, explained the HIPPO acronym; in section 40.3, mentioned toxins from landfills as a source of water pollution, clarified the explanations of pollution from sewage and of eutrophication, and added art to figure 40.12 to explain acid deposition; in section 40.4, updated data for atmospheric CO<sub>2</sub>, average temperature, and Arctic ice extent; added new Burning Question 40.1 comparing today’s pace of climate change to the rate of change throughout Earth’s history; in section 40.6, updated information about major habitat restoration projects, added a passage explaining the black-footed ferret recovery program, and added a passage about using CRISPR-Cas9 to add chestnut blight resistance genes to American chestnut trees; expanded the tips in Burning Question 40.2; in chapter ending, added a new Scientific Literacy question asking students to explore the science and ethics of political decisions. Added a new learning tool to ebook: a table listing selected consequences of climate change.

# Contents

Brief Contents iii | About the Author iv | Preface v | Author's Guide vi | Acknowledgments xii

## UNIT 1 Science, Chemistry, and Cells

### 1 | The Scientific Study of Life 2

Franco Banfi/WaterF/age fotostock

- 1.1 What Is Life? 4
  - A. Life Is Organized 4
  - B. Life Requires Energy 6
  - C. Life Maintains Internal Constancy 6
  - D. Life Reproduces, Grows, and Develops 7
  - E. Life Evolves 7
- 1.2 The Tree of Life Includes Three Main Branches 8
- 1.3 Scientists Study the Natural World 10
  - A. The Scientific Method Has Multiple Interrelated Parts 10
  - B. An Experimental Design Is a Careful Plan 11
  - C. Theories Are Comprehensive Explanations 12
  - D. Scientific Inquiry Has Limitations 13
  - E. Biology Continues to Advance 14
- 1.4 Investigating Life: The Orchid and the Moth 15

### 2 | The Chemistry of Life 18

- 2.1 Atoms Make Up All Matter 20
  - A. Elements Are Fundamental Types of Matter 20
  - B. Atoms Are Particles of Elements 20
  - C. Isotopes Have Different Numbers of Neutrons 21
- 2.2 Chemical Bonds Link Atoms 22
  - A. Electrons Determine Bonding 22
  - B. In an Ionic Bond, One Atom Transfers Electrons to Another Atom 23
  - C. In a Covalent Bond, Atoms Share Electrons 24
  - D. Partial Charges on Polar Molecules Make Hydrogen Bonds Possible 25
- 2.3 Water Is Essential to Life 26
  - A. Water Is Cohesive and Adhesive 26
  - B. Many Substances Dissolve in Water 26

- C. Water Regulates Temperature 27
- D. Water Expands As It Freezes 27
- E. Water Participates in Life's Chemical Reactions 28
- 2.4 Cells Have an Optimum pH 28
  - A. The pH Scale Expresses Acidity or Alkalinity 29
  - B. Buffers Regulate pH 29
- 2.5 Cells Contain Four Major Types of Organic Molecules 30
  - A. Large Organic Molecules Are Composed of Smaller Subunits 30
  - B. Carbohydrates Include Simple Sugars and Polysaccharides 31
  - C. Proteins Are Complex and Highly Versatile 32
  - D. Nucleic Acids Store and Transmit Genetic Information 34
  - E. Lipids Are Hydrophobic and Energy Rich 36
- 2.6 Investigating Life: Chemical Warfare on a Tiny Battlefield 41

### 3 | Cells 44

- 3.1 Cells Are the Units of Life 46
  - A. Simple Lenses Revealed the First Glimpses of Cells 46
  - B. The Cell Theory Emerges 46
  - C. Microscopes Magnify Cell Structures 47
  - D. All Cells Have Features in Common 49
- 3.2 Different Cell Types Characterize Life's Three Domains 50
  - A. Domain Bacteria Contains Earth's Most Abundant Organisms 50
  - B. Domain Archaea Includes Prokaryotes with Unique Biochemistry 51
  - C. Domain Eukarya Contains Organisms with Complex Cells 52
- 3.3 A Membrane Separates Each Cell from Its Surroundings 54
- 3.4 Eukaryotic Organelles Divide Labor 56
  - A. The Nucleus, Endoplasmic Reticulum, and Golgi Interact to Secrete Substances 57

- B. Lysosomes, Vacuoles, and Peroxisomes Are Cellular Digestion Centers 59
  - C. Mitochondria Extract Energy from Nutrients 60
  - D. Photosynthesis Occurs in Chloroplasts 60
- 3.5 The Cytoskeleton Supports Eukaryotic Cells 62**
- A. Proteins Form the Cytoskeleton 62
  - B. Cilia and Flagella Help Cells Move 63
- 3.6 Cells Stick Together and Communicate with One Another 64**
- A. Animal Cell Junctions Occur in Several Forms 64
  - B. Plasmodesmata Are Channels in Plant Cell Walls 64
- 3.7 Investigating Life: The Tiniest Compass 67**

## 4 | The Energy of Life 70

- 4.1 All Cells Capture and Use Energy 72**
- A. Energy Allows Cells to Do Life's Work 72
  - B. The Laws of Thermodynamics Describe Energy Transfer 73
- 4.2 Networks of Chemical Reactions Sustain Life 74**
- A. Chemical Reactions Require Energy Input or Release Energy 74
  - B. Linked Oxidation and Reduction Reactions Form Electron Transport Chains 75
- 4.3 ATP Is Cellular Energy Currency 76**
- A. Coupled Reactions Release and Store Energy in ATP 76
  - B. ATP Represents Short-Term Energy Storage 77
- 4.4 Enzymes Speed Biochemical Reactions 78**
- A. Enzymes Bring Reactants Together 78
  - B. Enzymes Have Partners 79
  - C. Cells Control Reaction Rates 79
- 4.5 Membrane Transport May Release Energy or Cost Energy 80**
- A. Passive Transport Does Not Require Energy Input 80
  - B. Active Transport Requires Energy Input 83
  - C. Endocytosis and Exocytosis Use Vesicles to Transport Substances 83
- 4.6 Investigating Life: Energy Efficiency in an Electric Fish 85**

## 5 | Photosynthesis 88

- 5.1 Life Depends on Photosynthesis 90**
- A. Photosynthesis Builds Carbohydrates Out of Carbon Dioxide and Water 90
  - B. Plants Use Carbohydrates in Many Ways 90
  - C. The Evolution of Photosynthesis Changed Planet Earth 91
- 5.2 Sunlight Is the Energy Source for Photosynthesis 92**
- A. What Is Light? 92
  - B. Photosynthetic Pigments Capture Light Energy 92
  - C. Chloroplasts Are the Sites of Photosynthesis 93
- 5.3 Photosynthesis Occurs in Two Stages 95**

- 5.4 The Light Reactions Begin Photosynthesis 96**
- A. Light Striking Photosystem II Provides the Energy to Produce ATP 96
  - B. Electrons from Photosystem I Reduce  $\text{NADP}^+$  to NADPH 97
- 5.5 The Carbon Reactions Produce Carbohydrates 98**
- 5.6  $\text{C}_3$ ,  $\text{C}_4$ , and CAM Plants Use Different Carbon Fixation Pathways 99**
- 5.7 Investigating Life: Solar-Powered Salamanders 101**

## 6 | Respiration and Fermentation 104

- 6.1 Cells Use Energy in Food to Make ATP 106**
- 6.2 Cellular Respiration Includes Three Main Processes 107**
- 6.3 In Eukaryotic Cells, Mitochondria Produce Most ATP 108**
- 6.4 Glycolysis Breaks Down Glucose to Pyruvate 109**
- 6.5 Aerobic Respiration Yields Abundant ATP 110**
- A. Pyruvate Is Oxidized to Acetyl CoA 110
  - B. The Krebs Cycle Produces ATP and High-Energy Electron Carriers 110
  - C. The Electron Transport Chain Drives ATP Formation 110
- 6.6 How Many ATPs Can One Glucose Molecule Yield? 112**
- 6.7 Other Food Molecules Enter the Energy-Extracting Pathways 113**
- 6.8 Some Energy Pathways Do Not Require Oxygen 114**
- A. Anaerobic Respiration Uses an Electron Acceptor Other Than  $\text{O}_2$  114
  - B. Fermenters Acquire ATP Only from Glycolysis 115
- 6.9 Photosynthesis and Respiration Are Ancient Pathways 116**
- 6.10 Investigating Life: Hot Plants Offer Heat Reward 117**

## UNIT 2 DNA, Inheritance, and Biotechnology

### 7 | DNA Structure and Gene Function 120

- 7.1 Experiments Identified the Genetic Material 122**
- A. Bacteria Can Transfer Genetic Information 122
  - B. Hershey and Chase Confirmed the Genetic Role of DNA 123
- 7.2 DNA Is a Double Helix of Nucleotides 124**

Gio.tto/Shutterstock

### 7.3 DNA Contains the “Recipes” for a Cell’s Proteins 126

- A. Protein Production Requires Transcription and Translation 126
- B. RNA Is an Intermediary Between DNA and a Protein 127

### 7.4 Transcription Uses a DNA Template to Build RNA 128

- A. Transcription Occurs in Three Steps 128
- B. mRNA Is Altered in the Nucleus of Eukaryotic Cells 129

### 7.5 Translation Builds the Protein 130

- A. The Genetic Code Links mRNA to Protein 130
- B. Translation Requires mRNA, tRNA, and Ribosomes 131
- C. Translation Occurs in Three Steps 132
- D. Proteins Must Fold Correctly After Translation 133

### 7.6 Cells Regulate Gene Expression 134

- A. Operons Are Groups of Bacterial Genes That Share One Promoter 134
- B. Eukaryotic Organisms Use Many Regulatory Methods 135

### 7.7 Mutations Change DNA Sequences 138

- A. Mutations Range from Silent to Devastating 138
- B. What Causes Mutations? 139
- C. Mutations May Pass to Future Generations 140
- D. Mutations Are Important 140

### 7.8 Investigating Life: Clues to the Origin of Language 141

## 8 DNA Replication, Binary Fission, and Mitosis 146

### 8.1 Cells Divide and Cells Die 148

- A. Sexual Life Cycles Include Mitosis, Meiosis, and Fertilization 148
- B. Cell Death Is Part of Life 148

### 8.2 DNA Replication Precedes Cell Division 150

### 8.3 Prokaryotes Divide by Binary Fission 152

### 8.4 Chromosomes Condense Before Cell Division 152

### 8.5 Mitotic Division Generates Exact Cell Copies 153

- A. DNA Is Copied During Interphase 154
- B. Chromosomes Divide During Mitosis 155
- C. The Cytoplasm Splits in Cytokinesis 156

### 8.6 Cancer Arises When Cells Divide Uncontrollably 156

- A. Chemical Signals Regulate Cell Division 156
- B. Cancer Cells Are Malignant 157
- C. Cancer Cells Differ from Normal Cells in Many Ways 157
- D. Cancer Treatments Remove or Kill Abnormal Cells 159
- E. Genes and Environment Both Can Increase Cancer Risk 160

### 8.7 Apoptosis Is Programmed Cell Death 162

### 8.8 Investigating Life: Evolutionary Strategies in the Race Against Cancer 163

## 9 Sexual Reproduction and Meiosis 166

### 9.1 Why Sex? 168

### 9.2 Diploid Cells Contain Two Homologous Sets of Chromosomes 169

### 9.3 Meiosis Is Essential in Sexual Reproduction 170

- A. Gametes Are Haploid Sex Cells 170
- B. Specialized Germ Cells Undergo Meiosis 170
- C. Meiosis Halves the Chromosome Number and Scrambles Alleles 171

### 9.4 In Meiosis, DNA Replicates Once, but the Nucleus Divides Twice 172

- A. In Meiosis I, Homologous Chromosomes Pair Up and Separate 172
- B. Meiosis II Yields Four Haploid Nuclei 173

### 9.5 Meiosis Generates Enormous Variability 174

- A. Crossing Over Shuffles Alleles 174
- B. Homologous Pairs Are Oriented Randomly During Metaphase I 174
- C. Fertilization Multiplies the Diversity 175

### 9.6 Mitosis and Meiosis Have Different Functions: A Summary 176

### 9.7 Errors Sometimes Occur in Meiosis 177

- A. Cells May Inherit Too Many or Too Few Chromosomes 177
- B. Mismatches During Crossing Over Can Change Chromosome Structure 178

### 9.8 Haploid Nuclei Are Packaged into Gametes 180

- A. In Humans, Gametes Form in Testes and Ovaries 180
- B. In Plants, Gametophytes Produce Gametes 181

### 9.9 Investigating Life: Evolving Germs Select for Sex in Worms 182

## 10 Patterns of Inheritance 186

### 10.1 Chromosomes Are Packets of Genetic Information: A Review 188

### 10.2 Mendel’s Experiments Uncovered Basic Laws of Inheritance 189

- A. Why Peas? 189
- B. Dominant Alleles Appear to Mask Recessive Alleles 189
- C. For Each Gene, a Cell’s Two Alleles May Be Identical or Different 190
- D. Every Generation Has a Name 191

### 10.3 The Two Alleles of a Gene End Up in Different Gametes 192

- A. The Simplest Punnett Squares Track the Inheritance of One Gene 192
- B. Meiosis Explains Mendel’s Law of Segregation 193

- 10.4 Genes on Different Chromosomes Are Inherited Independently 194**
- A. Tracking Two-Gene Inheritance May Require Large Punnett Squares 194
  - B. Meiosis Explains Mendel’s Law of Independent Assortment 194
  - C. The Product Rule Is a Useful Shortcut 196
- 10.5 Genes on the Same Chromosome May Be Inherited Together 196**
- A. Genes on the Same Chromosome Are Linked 196
  - B. Studying Recombination Reveals Gene Order on Chromosomes 197
- 10.6 Inheritance Patterns Are Rarely Simple 199**
- A. Incomplete Dominance and Codominance Add Phenotype Classes 199
  - B. Relating Genotype to Phenotype May Be Difficult 200
- 10.7 Sex-Linked Genes Have Unique Inheritance Patterns 201**
- A. X and Y Chromosomes Carry Sex-Linked Genes 201
  - B. X-Linked Recessive Disorders Affect More Males Than Females 202
  - C. X Inactivation Prevents “Double Dosing” of Proteins 203
- 10.8 Pedigrees Show Modes of Inheritance 205**
- 10.9 Most Traits Are Influenced by the Environment and Multiple Genes 207**
- A. The Environment Can Alter the Phenotype 207
  - B. Polygenic Traits Depend on More Than One Gene 207
- 10.10 Investigating Life: Heredity and the Hungry Hordes 209**

## 11 | DNA Technology 216

- 11.1 DNA Technology Is Changing the World 218**
- 11.2 DNA Technology’s Tools Apply to Individual Genes or Entire Genomes 219**
- A. Transgenic Organisms Contain DNA from Multiple Sources 219
  - B. DNA Sequencing Reveals the Order of Bases 221
  - C. PCR Replicates DNA in a Test Tube 223
  - D. DNA Profiling Detects Genetic Differences 224
- 11.3 Stem Cells and Cloning Add New Ways to Copy Cells and Organisms 226**
- A. Stem Cells Divide to Form Multiple Cell Types 226
  - B. Cloning Produces Identical Copies of an Organism 226
- 11.4 Many Medical Tests and Procedures Use DNA Technology 229**
- A. DNA Probes Detect Specific Sequences 229
  - B. Preimplantation Genetic Diagnosis Can Screen Embryos for Some Diseases 229
  - C. Genetic Testing Can Detect Existing Diseases 230
  - D. Gene Therapy Uses DNA to Treat Disease 230
  - E. CRISPR-Cas9 Cuts and Edits Specific Genes 231
  - F. Medical Uses of DNA Technology Raise Many Ethical Issues 232

- 11.5 Investigating Life: Weeds Get a Boost from Their Transgenic Cousins 232**

## UNIT 3 The Evolution of Life

### 12 | The Forces of Evolutionary Change 236

Chris Ryan/OJO Images/Getty Images

- 12.1 Evolution Acts on Populations 238**
- 12.2 Evolutionary Thought Has Evolved for Centuries 238**
- A. Many Explanations Have Been Proposed for Life’s Diversity 238
  - B. Charles Darwin’s Voyage Provided a Wealth of Evidence 240
  - C. *On the Origin of Species* Proposed Natural Selection as an Evolutionary Mechanism 240
  - D. Evolutionary Theory Continues to Expand 243
- 12.3 Natural Selection Molds Evolution 244**
- A. Adaptations Enhance Reproductive Success 244
  - B. Natural Selection Eliminates Poorly Adapted Phenotypes 245
  - C. Natural Selection Does Not Have a Goal 246
  - D. What Does “Survival of the Fittest” Really Mean? 246
- 12.4 Evolution Is Inevitable in Real Populations 248**
- A. At Hardy–Weinberg Equilibrium, Allele Frequencies Do Not Change 248
  - B. In Reality, Allele Frequencies Always Change 249
- 12.5 Natural Selection Can Shape Populations in Many Ways 250**
- 12.6 Sexual Selection Directly Influences Reproductive Success 252**
- 12.7 Evolution Occurs in Several Additional Ways 253**
- A. Mutation Fuels Evolution 253
  - B. Genetic Drift Occurs by Chance 253
  - C. Nonrandom Mating Concentrates Alleles Locally 255
  - D. Gene Flow Moves Alleles Between Populations 255
- 12.8 Investigating Life: Size Matters in Fishing Frenzy 256**

### 13 | Evidence of Evolution 260

- 13.1 Clues to Evolution Lie in the Earth, Body Structures, and Molecules 262**
- 13.2 Fossils Record Evolution 264**
- A. Fossils Form in Many Ways 264
  - B. The Fossil Record Is Often Incomplete 266
  - C. The Age of a Fossil Can Be Estimated in Two Ways 266

- 13.3 Biogeography Considers Species' Geographical Locations 268**
- A. The Theory of Plate Tectonics Explains Earth's Shifting Continents 268
  - B. Species Distributions Reveal Evolutionary Events 268
- 13.4 Anatomical Comparisons May Reveal Common Descent 270**
- A. Homologous Structures Have a Shared Evolutionary Origin 270
  - B. Vestigial Structures Have Lost Their Functions 270
  - C. Convergent Evolution Produces Superficial Similarities 271
- 13.5 Embryonic Development Patterns Provide Evolutionary Clues 272**
- 13.6 Molecules Reveal Relatedness 274**
- A. Comparing DNA and Protein Sequences May Reveal Close Relationships 274
  - B. Molecular Clocks Help Assign Dates to Evolutionary Events 275
- 13.7 Investigating Life: Limbs Gained and Limbs Lost 276**

## 14 Speciation and Extinction 280

- 14.1 What Is a Species? 282**
- A. Linnaeus Devised the Binomial Naming System 282
  - B. Species Can Be Defined Based on the Potential to Interbreed 282
- 14.2 Reproductive Barriers Cause Species to Diverge 284**
- A. Prezygotic Barriers Prevent Fertilization 285
  - B. Postzygotic Barriers Prevent the Development of Fertile Offspring 285
- 14.3 Spatial Patterns Define Three Types of Speciation 286**
- A. Allopatric Speciation Reflects a Geographical Barrier 286
  - B. Parapatric Speciation Occurs in Neighboring Regions 288
  - C. Sympatric Speciation Occurs in a Shared Habitat 288
  - D. Determining the Type of Speciation May Be Difficult 289
- 14.4 Speciation May Be Gradual or May Occur in Bursts 290**
- A. Gradualism and Punctuated Equilibrium Are Two Models of Speciation 290
  - B. Bursts of Speciation Occur During Adaptive Radiation 291
- 14.5 Extinction Marks the End of the Line 292**
- A. Many Factors Can Combine to Put a Species at Risk 292
  - B. Extinction Rates Have Varied over Time 292
  - C. Extinctions Are Accelerating 294
- 14.6 Biological Classification Systems Are Based on Common Descent 294**
- A. The Taxonomic Hierarchy Organizes Species into Groups 294

- B. A Cladistics Approach Is Based on Shared Derived Traits 295
  - C. Cladograms Depict Hypothesized Evolutionary Relationships 296
  - D. Many Traditional Groups Are Not Clades 298
- 14.7 Investigating Life: Plant Protection Rackets May Stimulate Speciation 300**

## 15 The Origin and History of Life 304

- 15.1 Life's Origin Remains Mysterious 306**
- A. The First Organic Molecules May Have Formed in a Chemical "Soup" 306
  - B. Some Investigators Suggest an "RNA World" 309
  - C. Membranes Enclosed the Molecules 309
  - D. Early Life Changed Earth Forever 309
- 15.2 Complex Cells and Multicellularity Arose over a Billion Years Ago 311**
- A. Endosymbiosis Explains the Origin of Mitochondria and Chloroplasts 311
  - B. Multicellularity May Also Have Its Origin in Cooperation 312
- 15.3 Life's Diversity Exploded in the Past 500 Million Years 314**
- A. The Strange Ediacarans Flourished Late in the Precambrian 314
  - B. Paleozoic Plants and Animals Emerged onto Land 314
  - C. Reptiles and Flowering Plants Thrived During the Mesozoic Era 317
  - D. Mammals Diversified During the Cenozoic Era 318
- 15.4 Fossils and DNA Tell the Human Evolution Story 320**
- A. Humans Are Primates 320
  - B. Molecular Evidence Documents Primate Relationships 322
  - C. Human Evolution Is Partially Recorded in Fossils 323
  - D. Environmental Changes Have Spurred Human Evolution 324
  - E. Migration and Culture Have Changed *Homo sapiens* 325
- 15.5 Investigating Life: What Makes Us Human? 326**

## UNIT 4 The Diversity of Life

### 16 Viruses 330

- 16.1 Viruses Are Genes Wrapped in a Protein Coat 332**
- A. Viruses Are Smaller and Simpler Than Cells 332
  - B. A Virus's Host Range Consists of the Organisms It Infects 333
  - C. Are Viruses Alive? 333
- 16.2 Viral Replication Occurs in Five Stages 334**
- 16.3 Viruses May Kill Bacteria Immediately or Their DNA May "Hide" in the Cell 335**

Yuriy Dyachyshyn/AFP/Getty Images

**16.4 Illnesses Caused by Animal Viruses May Be Mild or Severe 336**

- A. Symptoms Result from Cell Death and the Immune Response 336
- B. Some Animal Viruses Linger for Years 336
- C. Drugs and Vaccines Help Fight Viral Infections 337

**16.5 Viruses Cause Diseases in Plants 339****16.6 Viroids and Prions Are Other Noncellular Infectious Agents 340**

- A. A Viroid Is an Infectious RNA Molecule 340
- B. A Prion Is an Infectious Protein 340

**16.7 Investigating Life: Scientific Detectives Follow HIV's Trail 341****17 Bacteria and Archaea 344****17.1 Prokaryotes Are a Biological Success Story 346****17.2 Prokaryote Classification Traditionally Relies on Cell Structure and Metabolism 347**

- A. Microscopes Reveal Cell Structures 347
- B. Metabolic Pathways May Be Useful in Classification 350
- C. Molecular Data Reveal Evolutionary Relationships 351
- D. Horizontal Gene Transfer Complicates Classification 351

**17.3 Prokaryotes Include Two Domains with Enormous Diversity 352**

- A. Domain Bacteria Includes Many Familiar Groups 352
- B. Many, but Not All, Archaea Are "Extremophiles" 353

**17.4 Bacteria and Archaea Are Essential to All Life 354**

- A. Microbes Form Vital Links in Ecosystems 354
- B. Bacteria and Archaea Live in and on Us 354
- C. Humans Put Many Prokaryotes to Work 356

**17.5 Investigating Life: Bacterial Evolution Goes "Hog Wild" on the Farm 356****18 Protists 360****18.1 Protists Lie at the Crossroads Between Simple and Complex Organisms 362**

- A. What Is a Protist? 362
- B. Protists Are Important in Many Ways 362
- C. Protists Have a Lengthy Evolutionary History 362

**18.2 Algae Are Photosynthetic Protists 364**

- A. Euglenoids Are Heterotrophs and Autotrophs 364
- B. Dinoflagellates Are "Whirling Cells" 364
- C. Golden Algae, Diatoms, and Brown Algae Contain Yellowish Pigments 365
- D. Red Algae Can Live in Deep Water 366
- E. Green Algae Are the Closest Relatives of Land Plants 366

**18.3 Some Heterotrophic Protists Resemble Fungi 368**

- A. Slime Molds Are Unicellular and Multicellular 368
- B. Water Molds Are Decomposers and Parasites 368

**18.4 Protozoa Are Diverse Heterotrophic Protists 370**

- A. Several Flagellated Protozoa Cause Disease 370

B. Amoeboid Protozoa Produce Pseudopodia 370

C. Ciliates Are Common Protozoa with Complex Cells 371

D. Apicomplexans Include Nonmotile Animal Parasites 372

**18.5 Protist Classification Is Changing Rapidly 374****18.6 Investigating Life: Shining a Spotlight on Danger 375****19 Plants 378****19.1 Plants Have Changed the World 380**

- A. Green Algae Are the Closest Relatives of Plants 380
- B. Plants Are Adapted to Life on Land 382

**19.2 Bryophytes Are the Simplest Plants 384**

- A. Bryophytes Lack Vascular Tissue 384
- B. Bryophytes Have a Conspicuous Gametophyte 385

**19.3 Seedless Vascular Plants Have Xylem and Phloem but No Seeds 386**

- A. Seedless Vascular Plants Include Ferns and Their Close Relatives 386
- B. Seedless Vascular Plants Have a Conspicuous Sporophyte and Swimming Sperm 387

**19.4 Gymnosperms Are "Naked Seed" Plants 388**

- A. Gymnosperms Include Conifers and Three Related Groups 388
- B. Conifers Produce Pollen and Seeds in Cones 389

**19.5 Angiosperms Produce Seeds in Fruits 390**

- A. Most Angiosperms Are Eudicots or Monocots 390
- B. Flowers and Fruits Are Unique to the Angiosperm Life Cycle 390
- C. Wind and Animals Often Participate in Angiosperm Reproduction 392

**19.6 Investigating Life: Genetic Messages from Ancient Ecosystems 394****20 Fungi 398****20.1 Fungi Are Essential Decomposers 400**

- A. Fungi Are Eukaryotic Heterotrophs That Digest Food Externally 400
- B. Fungal Classification Is Traditionally Based on Reproductive Structures 402

**20.2 Chytridiomycetes Produce Swimming Spores 403****20.3 Zygomycetes Are Fast-Growing and Prolific 404****20.4 Glomeromycetes Colonize Living Plant Roots 405****20.5 Ascomycetes Are the Sac Fungi 406****20.6 Basidiomycetes Are the Familiar Club Fungi 408****20.7 Fungi Interact with Other Organisms 410**

- A. Endophytes Colonize Plant Tissues 410
- B. Mycorrhizal Fungi Exchange Materials with Roots 410

- C. Some Ants Cultivate Fungi 410
- D. Lichens Are Dual Organisms 411

## 20.8 Investigating Life: The Battle for Position in Cacao Tree Leaves 412

# 21 | Animals 416

## 21.1 Animals Live Nearly Everywhere 418

- A. What Is an Animal? 418
- B. Animal Life Began in the Water 418
- C. Animal Features Reflect Shared Ancestry 419
- D. Biologists Also Consider Additional Characteristics 421

## 21.2 Sponges Are Simple Animals That Lack Differentiated Tissues 423

## 21.3 Cnidarians Are Radially Symmetrical, Aquatic Animals 424

## 21.4 Flatworms Have Bilateral Symmetry and Incomplete Digestive Tracts 425

## 21.5 Mollusks Are Soft, Unsegmented Animals 427

## 21.6 Annelids Are Segmented Worms 428

## 21.7 Nematodes Are Unsegmented, Cylindrical Worms 430

## 21.8 Arthropods Have Exoskeletons and Jointed Appendages 432

- A. Arthropods Have Complex Organ Systems 432
- B. Arthropods Are the Most Diverse Animals 434

## 21.9 Echinoderm Adults Have Five-Part, Radial Symmetry 436

## 21.10 Most Chordates Are Vertebrates 438

- A. Four Key Features Distinguish Chordates 438
- B. Many Features Reveal Evolutionary Relationships Among Chordates 439

## 21.11 Tunicates and Lancelets Are Invertebrate Chordates 442

## 21.12 Hagfishes and Lampreys Are Craniates Lacking Jaws 443

## 21.13 Fishes Are Aquatic Vertebrates with Jaws, Gills, and Fins 444

- A. Cartilaginous Fishes Include Sharks, Skates, and Rays 444
- B. Bony Fishes Include Two Main Lineages 444
- C. Fishes Changed the Course of Vertebrate Evolution 445

## 21.14 Amphibians Lead a Double Life on Land and in Water 446

- A. Amphibians Were the First Tetrapods 446
- B. Amphibians Include Three Main Lineages 446

## 21.15 Reptiles Were the First Vertebrates to Thrive on Dry Land 448

- A. Nonavian Reptiles Include Four Main Groups 448
- B. Birds Are Warm, Feathered Reptiles 450

## 21.16 Mammals Are Warm, Furry Milk-Drinkers 451

- A. Mammals Share a Common Ancestor with Reptiles 451
- B. Mammals Lay Eggs or Bear Live Young 452

## 21.17 Investigating Life: Sponges Fill Holes in Animal Evolution 453

## UNIT 5 Plant Life

# 22 | Plant Form and Function 460

Mads Nissen/Nobel Peace Centre/  
Panos/Redux

## 22.1 Vegetative Plant Parts Include Stems, Leaves, and Roots 462

## 22.2 Plant Cells Build Tissues 465

- A. Plant Cells Form Three Main Tissue Systems 465
- B. Plants Have Several Cell Types 466

## 22.3 Tissues Build Stems, Leaves, and Roots 469

- A. Stems Support Leaves 469
- B. Leaves Are the Primary Organs of Photosynthesis 469
- C. Roots Absorb Water and Minerals and Anchor the Plant 470

## 22.4 Plants Have Flexible Growth Patterns, Thanks to Meristems 473

- A. Plants Grow by Adding New Modules 473
- B. Plant Growth Occurs at Meristems 473
- C. In Primary Growth, Apical Meristems Lengthen Stems and Roots 474
- D. In Secondary Growth, Lateral Meristems Thicken Stems and Roots 474

## 22.5 Investigating Life: An Army of Tiny Watchdogs 477

# 23 | Plant Nutrition and Transport 482

## 23.1 Soil and Air Provide Water and Nutrients 484

- A. Plants Require 16 Essential Elements 484
- B. Soils Have Distinct Layers 484
- C. Leaves and Roots Absorb Essential Elements 485

## 23.2 Water and Minerals Are Pulled Up to Leaves in Xylem 487

- A. Water Evaporates from Leaves in Transpiration 487
- B. Water and Dissolved Minerals Enter at the Roots 488
- C. Xylem Transport Relies on Cohesion 488
- D. The Cuticle and Stomata Help Conserve Water 489

## 23.3 Sugars Are Pushed in Phloem to Nonphotosynthetic Cells 490

- A. Phloem Sap Contains Sugars and Other Organic Compounds 490
- B. The Pressure Flow Theory Explains Phloem Function 490

## 23.4 Parasitic Plants Tap into Another Plant's Vascular Tissue 492

## 23.5 Investigating Life: The Hidden Cost of Traps 492

## 24 Reproduction and Development of Flowering Plants 496

- 24.1 **Angiosperms Reproduce Asexually and Sexually 498**
  - A. Asexual Reproduction Yields Clones 498
  - B. Sexual Reproduction Generates Variability 499
- 24.2 **The Angiosperm Life Cycle Includes Flowers, Fruits, and Seeds 500**
  - A. Flowers Are Reproductive Organs 500
  - B. The Pollen Grain and Embryo Sac Are Gametophytes 501
  - C. Pollination Brings Pollen to the Stigma 501
  - D. Double Fertilization Yields Zygote and Endosperm 502
  - E. A Seed Is an Embryo and Its Food Supply Inside a Seed Coat 503
  - F. The Fruit Develops from the Ovary 504
  - G. Fruits Protect and Disperse Seeds 505
- 24.3 **Plant Growth Begins with Seed Germination 506**
- 24.4 **Hormones Regulate Plant Growth and Development 507**
  - A. Auxins and Cytokinins Are Essential for Plant Growth 507
  - B. Gibberellins, Ethylene, and Abscisic Acid Influence Plant Development in Many Ways 508
  - C. Biologists Continue to Discover Additional Plant Hormones 509
- 24.5 **Light Is a Powerful Influence on Plant Life 510**
  - A. Phototropism Is Growth Toward Light 510
  - B. Phytochrome Regulates Seed Germination, Daily Rhythms, and Flowering 511
- 24.6 **Plants Respond to Gravity and Touch 513**
- 24.7 **Plant Parts Die or Become Dormant 514**
- 24.8 **Investigating Life: A Red Hot Chili Pepper Paradox 515**

## UNIT 6 Animal Life

### 25 Animal Tissues and Organ Systems 518

Daniel Garcia/AFP/Getty Images

- 25.1 **Specialized Cells Build Animal Bodies 520**
- 25.2 **Animals Consist of Four Tissue Types 522**
  - A. Epithelial Tissue Covers Surfaces 522
  - B. Most Connective Tissues Bind Other Tissues Together 523
  - C. Muscle Tissue Provides Movement 524
  - D. Nervous Tissue Forms a Rapid Communication Network 525

- 25.3 **Organ Systems Are Interconnected 526**
  - A. The Nervous and Endocrine Systems Coordinate Communication 526
  - B. The Skeletal and Muscular Systems Support and Move the Body 526
  - C. The Digestive, Circulatory, and Respiratory Systems Help Acquire Energy 526
  - D. The Urinary, Integumentary, Immune, and Lymphatic Systems Protect the Body 527
  - E. The Reproductive System Produces the Next Generation 527
- 25.4 **Organ System Interactions Promote Homeostasis 528**
- 25.5 **The Integumentary System Regulates Temperature and Conserves Moisture 529**
- 25.6 **Investigating Life: Vitamins and the Evolution of Human Skin Pigmentation 531**

### 26 The Nervous System 534

- 26.1 **The Nervous System Forms a Rapid Communication Network 536**
  - A. Invertebrates Have Nerve Nets, Nerve Ladders, or Nerve Cords 536
  - B. Vertebrate Nervous Systems Are Highly Centralized 537
- 26.2 **Neurons Are Functional Units of a Nervous System 538**
  - A. A Typical Neuron Consists of a Cell Body, Dendrites, and an Axon 538
  - B. The Nervous System Includes Three Classes of Neurons 539
- 26.3 **Action Potentials Convey Messages 540**
  - A. A Neuron at Rest Has a Negative Charge 540
  - B. A Neuron's Membrane Potential Reverses During an Action Potential 540
  - C. The Myelin Sheath Speeds Impulse Conduction 543
- 26.4 **Neurotransmitters Pass the Message from Cell to Cell 544**
  - A. Neurons Communicate at Synapses 544
  - B. A Neuron Integrates Signals from Multiple Synapses 545
- 26.5 **The Peripheral Nervous System Consists of Nerve Cells Outside the Central Nervous System 546**
- 26.6 **The Central Nervous System Consists of the Spinal Cord and Brain 548**
  - A. The Spinal Cord Transmits Information Between Body and Brain 548
  - B. The Human Brain Is Divided into Several Regions 548
  - C. Many Brain Regions Participate in Memory Formation 551
  - D. Damage to the Central Nervous System Can Be Devastating 551
- 26.7 **Investigating Life: Scorpion Stings Don't Faze Grasshopper Mice 554**

## 27 | The Senses 558

- 27.1 Diverse Senses Operate by the Same Principles 560**
  - A. Sensory Receptors Respond to Stimuli by Generating Action Potentials 560
  - B. Continuous Stimulation May Cause Sensory Adaptation 561
- 27.2 The General Senses Detect Touch, Temperature, Pain, and Position 562**
- 27.3 The Senses of Smell and Taste Detect Chemicals 563**
  - A. Chemoreceptors in the Nose Detect Odor Molecules 563
  - B. Chemoreceptors in the Mouth Detect Taste 564
- 27.4 Vision Depends on Light-Sensitive Cells 565**
  - A. Invertebrate Eyes Take Many Forms 565
  - B. In the Vertebrate Eye, Light Is Focused on the Retina 565
  - C. Signals Travel from the Retina to the Optic Nerve and Brain 566
- 27.5 The Senses of Hearing and Equilibrium Begin in the Ears 568**
  - A. Mechanoreceptors in the Inner Ear Detect Sound Waves 568
  - B. The Inner Ear Also Provides the Sense of Equilibrium 569
- 27.6 Investigating Life: How Do Whales Taste? 570**

## 28 | The Endocrine System 574

- 28.1 The Endocrine System Uses Hormones to Communicate 576**
  - A. Endocrine Glands Secrete Hormones That Interact with Target Cells 576
  - B. The Nervous and Endocrine Systems Work Together 577
- 28.2 Hormones Stimulate Responses in Target Cells 578**
  - A. Water-Soluble Hormones Trigger Second Messenger Systems 578
  - B. Lipid-Soluble Hormones Directly Alter Gene Expression 579
- 28.3 The Hypothalamus and Pituitary Gland Oversee Endocrine Control 580**
  - A. The Posterior Pituitary Stores and Releases Two Hormones 581
  - B. The Anterior Pituitary Produces and Secretes Six Hormones 581
- 28.4 Hormones from Many Glands Regulate Metabolism 582**
  - A. The Thyroid Gland Sets the Metabolic Pace 582
  - B. The Parathyroid Glands Control Calcium Level 583
  - C. The Adrenal Glands Coordinate the Body's Stress Responses 583
  - D. The Pancreas Regulates Blood Glucose 584
  - E. The Pineal Gland Secretes Melatonin 585

**28.5 Hormones from the Ovaries and Testes Control Reproduction 586**

**28.6 Investigating Life: Addicted to Affection 586**

## 29 | The Skeletal and Muscular Systems 590

- 29.1 Skeletons Take Many Forms 592**
- 29.2 The Vertebrate Skeleton Features a Central Backbone 593**
- 29.3 Bones Provide Support, Protect Internal Organs, and Supply Calcium 594**
  - A. Bones Consist Mostly of Bone Tissue and Cartilage 594
  - B. Bones Are Constantly Built and Degraded 596
  - C. Bones Help Regulate Calcium Homeostasis 596
  - D. Bone Meets Bone at a Joint 597
- 29.4 Muscle Movement Requires Contractile Proteins, Calcium, and ATP 598**
  - A. Actin and Myosin Filaments Fill Muscle Cells 598
  - B. Sliding Filaments Are the Basis of Muscle Fiber Contraction 599
  - C. Motor Neurons Stimulate Muscle Fiber Contraction 600
- 29.5 Muscle Fibers Generate ATP in Many Ways 602**
- 29.6 Many Muscle Fibers Combine to Form One Muscle 603**
  - A. Each Muscle May Contract with Variable Force 603
  - B. Muscles Contain Slow- and Fast-Twitch Fibers 603
  - C. Exercise Strengthens Muscles 604
- 29.7 Investigating Life: Did a Myosin Gene Mutation Make Humans Brainier? 604**

## 30 | The Circulatory System 608

- 30.1 Circulatory Systems Deliver Nutrients and Remove Wastes 610**
  - A. Circulatory Systems Are Open or Closed 610
  - B. Vertebrate Circulatory Systems Have Become Increasingly Complex 611
- 30.2 Blood Is a Complex Mixture 612**
  - A. Plasma Carries Many Dissolved Substances 612
  - B. Red Blood Cells Transport Oxygen 613
  - C. White Blood Cells Fight Infection 613
  - D. Blood Clotting Requires Platelets and Plasma Proteins 614
- 30.3 Blood Circulates Through the Heart and Blood Vessels 615**
- 30.4 The Human Heart Is a Muscular Pump 616**
  - A. The Heart Has Four Chambers 616
  - B. The Right and Left Halves of the Heart Deliver Blood Along Different Paths 616

- C. Cardiac Muscle Cells Produce the Heartbeat 617
- D. Exercise Strengthens the Heart 618
- 30.5 Blood Vessels Form the Circulation Pathway 619**
  - A. Arteries, Capillaries, and Veins Have Different Structures 619
  - B. Blood Pressure and Velocity Differ Among Vessel Types 620
- 30.6 The Lymphatic System Maintains Circulation and Protects Against Infection 623**
- 30.7 Investigating Life: In (Extremely) Cold Blood 624**

## 31 | The Respiratory System 628

- 31.1 Gases Diffuse Across Respiratory Surfaces 630**
  - A. Some Invertebrates Exchange Gases Across the Body Wall or in Internal Tubules 631
  - B. Gills Exchange Gases with Water 632
  - C. Terrestrial Vertebrates Exchange Gases in Lungs 632
- 31.2 The Human Respiratory System Delivers Air to the Lungs 634**
  - A. The Nose, Pharynx, and Larynx Form the Upper Respiratory Tract 634
  - B. The Lower Respiratory Tract Consists of the Trachea and Lungs 635
- 31.3 Breathing Requires Pressure Changes in the Lungs 636**
- 31.4 Blood Delivers Oxygen and Removes Carbon Dioxide 638**
  - A. Blood Carries Gases in Several Forms 638
  - B. Blood Gas Levels Help Regulate the Breathing Rate 638
- 31.5 Investigating Life: Why Do Bugs Hold Their Breath? 640**

## 32 | Digestion and Nutrition 644

- 32.1 Digestive Systems Derive Nutrients from Food 646**
  - A. Animals Eat to Obtain Energy and Building Blocks 646
  - B. How Much Food Does an Animal Need? 646
  - C. Animals Process Food in Four Stages 646
  - D. Animal Diets and Feeding Strategies Vary Greatly 647
- 32.2 Animal Digestive Tracts Take Many Forms 648**
- 32.3 The Human Digestive System Consists of Several Organs 650**
  - A. Digestion Begins in the Mouth 650
  - B. The Stomach Stores, Digests, and Churns Food 651
  - C. The Small Intestine Digests and Absorbs Nutrients 652
  - D. The Large Intestine Completes Nutrient and Water Absorption 654

- 32.4 A Healthy Diet Includes Essential Nutrients and the Right Number of Calories 656**
  - A. A Varied Diet Is Essential to Good Health 656
  - B. Body Weight Reflects Food Intake and Activity Level 658
  - C. Starvation: Too Few Calories to Meet the Body's Needs 659
  - D. Obesity: More Calories Than the Body Needs 660
- 32.5 Investigating Life: The Cost of a Sweet Tooth 661**

## 33 | Regulation of Temperature and Body Fluids 664

- 33.1 Animals Regulate Their Internal Temperature 666**
  - A. Heat Gains and Losses Determine an Animal's Body Temperature 666
  - B. Several Adaptations Help an Animal to Adjust Its Temperature 667
- 33.2 Animals Regulate Water and Ions in Body Fluids 669**
- 33.3 Nitrogenous Wastes Include Ammonia, Urea, and Uric Acid 670**
- 33.4 The Urinary System Produces, Stores, and Eliminates Urine 671**
- 33.5 The Nephron Is the Functional Unit of the Kidney 672**
  - A. Nephrons Interact Closely with Blood Vessels 672
  - B. Urine Formation Includes Filtration, Reabsorption, and Secretion 672
  - C. The Glomerular Capsule Filters Blood 674
  - D. Reabsorption and Secretion Occur in the Renal Tubule 674
  - E. The Collecting Duct Conserves More Water 675
  - F. Hormones Regulate Kidney Function 675
- 33.6 Investigating Life: New Clues in a Dinosaur-Sized Mystery 676**

## 34 | The Immune System 680

- 34.1 Many Cells, Tissues, and Organs Defend the Body 682**
  - A. White Blood Cells Play Major Roles in the Immune System 682
  - B. The Lymphatic System Produces and Transports Many Immune System Cells 683
  - C. The Immune System Has Two Main Subdivisions 683
- 34.2 Innate Defenses Are Nonspecific and Act Early 684**
  - A. External Barriers Form the First Line of Defense 684
  - B. Internal Innate Defenses Destroy Invaders 684
- 34.3 Adaptive Immunity Defends Against Specific Pathogens 686**
  - A. Helper T Cells Play a Central Role in Adaptive Immunity 686

- B. Cytotoxic T Cells Provide Cell-Mediated Immunity 687
- C. B Cells Direct the Humoral Immune Response 687
- D. The Immune Response Turns Off Once the Threat Is Gone 690
- E. The Secondary Immune Response Is Stronger Than the Primary Response 690

#### 34.4 Vaccines Jump-Start Immunity 692

#### 34.5 Several Disorders Affect the Immune System 693

- A. Autoimmune Disorders Are Devastating and Mysterious 693
- B. Immunodeficiencies Lead to Opportunistic Infections 693
- C. Allergies Misdirect the Immune Response 694
- D. A Pregnant Woman's Immune System May Attack Her Fetus 695

#### 34.6 Investigating Life: The Hidden Cost of Hygiene 696

## 35 Animal Reproduction and Development 700

#### 35.1 Animal Development Begins with Reproduction 702

- A. Reproduction Is Asexual or Sexual 702
- B. Gene Expression Dictates Animal Development 702
- C. Development Is Indirect or Direct 703

#### 35.2 Males Produce Sperm Cells 704

- A. Male Reproductive Organs Are Inside and Outside the Body 704
- B. Spermatogenesis Yields Sperm Cells 705
- C. Hormones Influence Male Reproductive Function 706

#### 35.3 Females Produce Egg Cells 707

- A. Female Reproductive Organs Are Inside the Body 707
- B. Oogenesis Yields Egg Cells 708
- C. Hormones Influence Female Reproductive Function 709
- D. Hormonal Fluctuations Can Cause Discomfort 711

#### 35.4 Reproductive Health Considers Contraception and Disease 711

#### 35.5 The Human Infant Begins Life as a Zygote 714

- A. Fertilization Initiates Pregnancy 714
- B. The Preembryonic Stage Ends When Implantation Is Complete 715
- C. Organs Take Shape During the Embryonic Stage 716
- D. Organ Systems Become Functional in the Fetal Stage 719
- E. Muscle Contractions in the Uterus Drive Childbirth 720

#### 35.6 Birth Defects Have Many Causes 721

#### 35.7 Investigating Life: Sexual Cannibalism and Silk Restraints 723

## UNIT 7 The Ecology of Life

### 36 Animal Behavior 728

Gerald Hinde/Gallo Images/Getty Images

#### 36.1 Animal Behaviors Have Proximate and Ultimate Causes 730

#### 36.2 Animal Behaviors Combine Innate and Learned Components 731

- A. Innate Behaviors Do Not Require Experience 731
- B. Learning Requires Experience 732
- C. Genes and Environment Interact to Determine Behavior 733

#### 36.3 Many Behaviors Improve Survival 734

- A. Some Animals Can Find Specific Locations 734
- B. Animals Balance the Energy Content and Costs of Acquiring Food 735
- C. Avoiding Predation Is Another Key to Survival 736

#### 36.4 Many Behaviors Promote Reproductive Success 738

- A. Courtship Sets the Stage for Mating 738
- B. Sexual Selection Leads to Differences Between the Sexes 738
- C. Animals Differ in Mating Systems and Degrees of Parental Care 739
- D. Human Reproductive Choices May Reflect Natural Selection 740

#### 36.5 Social Behaviors Often Occur in Groups 741

- A. Group Living Has Benefits and Costs 741
- B. Dominance Hierarchies and Territoriality Reduce Competition 742
- C. Kin Selection and Reciprocal Altruism Explain Some Acts of Cooperation 742
- D. Eusocial Animals Have Highly Developed Societies 743

#### 36.6 Investigating Life: Playing "Dress Up" on the Reef 744

### 37 Populations 748

#### 37.1 A Population Consists of Individuals of One Species 750

- A. Density and Distribution Patterns Are Static Measures of a Population 750
- B. Isolated Subpopulations May Evolve into New Species 750

#### 37.2 Births and Deaths Help Determine Population Size 752

- A. Births Add Individuals to a Population 752
- B. Survivorship Curves Show the Probability of Dying at a Given Age 753

#### 37.3 Population Growth May Be Exponential or Logistic 754

- A. Growth Is Exponential When Resources Are Unlimited 754
- B. Population Growth Eventually Slows 755
- C. Many Conditions Limit Population Size 757

**37.4 Natural Selection Influences Life Histories 758**

- A. Organisms Balance Reproduction Against Other Requirements 758
- B. Opportunistic and Equilibrium Life Histories Reflect the Trade-Off Between Quantity and Quality 758

**37.5 The Human Population Continues to Grow 759**

- A. Birth Rates and Death Rates Vary Worldwide 759
- B. The Ecological Footprint Is an Estimate of Resource Use 761

## LEARN HOW TO LEARN

### Real Learning Takes Time

You got good at basketball, running, dancing, art, music, or video games by putting in lots of practice. Likewise, you will need to commit time to your biology course if you hope to do well. To get started, look for the Learn How to Learn tip in each chapter of this textbook. Each hint is designed to help you use your study time productively.

With practice, you'll discover that all concepts in biology are connected. The Survey the Landscape figure in every chapter highlights each chapter's place in the “landscape” of the entire unit. Use it, along with the more detailed Pull It Together concept map in the chapter summary, to see how each chapter's content fits into the unit's big picture.

# UNIT 1

## Life Is Everywhere

Welcome to biology, the scientific study of life. Living organisms surround us. You are alive, and so are your friends, your pets, and the plants in your home and yard. Bacteria thrive on and in your body. Any food you ate today was (until recently, anyway) alive. And the news is full of biology-related discoveries about fossils, new cancer treatments, genetics, global climate change, and the environment.

Stories such as these enjoy frequent media coverage because this is an exciting time to study biology. Not only is the field changing rapidly, but its new discoveries and applications might change your life. DNA technology has brought us genetically engineered bacteria that can manufacture life-saving drugs—and genetically engineered plants that produce their own pesticides. This same technology may one day enable physicians to routinely cure hemophilia, cystic fibrosis, and other genetic diseases by supplementing a person’s faulty DNA with a functional “patch.”

Biology also includes the study of nonhuman life. We exist only because of our interactions with other species, which provide food, oxygen, clean water, clothing, shelter, and other necessities. Even species that do not directly “serve” us are essential to the ecosystems that sustain all life. Human activities, however, are pushing many ecosystems dangerously out of balance.

Consider the “crown of thorns” sea star shown here. These animals are notorious for their arsenal of sharp, venomous spines, which may cause painful wounds. At low population densities, their coral-eating habits help maintain reef biodiversity. Sometimes, however, huge numbers of sea stars destroy entire patches of coral. What causes these infestations? Many researchers point to nutrient-polluted runoff from nearby farms and cities. The nutrient influx triggers a population explosion of algae, which sea star larvae eat as they develop into adults. Removing the adults from an infested reef is dangerous and labor-intensive, but help is coming from an unusual source: Underwater robots have been programmed to seek out the crown of thorns and deliver a lethal injection.

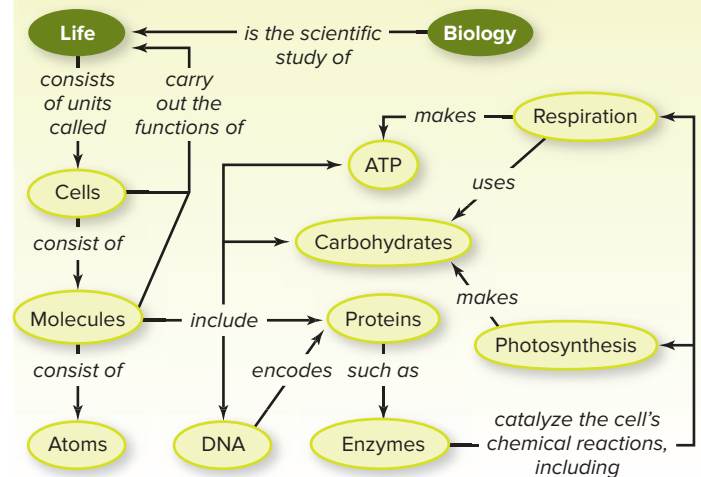

The list of biology-related topics goes on and on: global climate change, stem cell therapies, new cancer treatments, infectious disease, improved crop plants, synthetic life, infertility treatment, endangered species, DNA fingerprinting, biofuels, pollution, the history of life, and more. This book will bring you a taste of modern biology and help you make sense of the science-related news you see every day. Chapter 1 begins your journey by introducing the scope of biology and explaining how science teaches us what we know about life.

## LEARNING OUTLINE

-  **1.1 What Is Life?**
-  **1.2 The Tree of Life Includes Three Main Branches**
-  **1.3 Scientists Study the Natural World**
-  **1.4 Investigating Life: The Orchid and the Moth**

## SURVEY THE LANDSCAPE Science, Chemistry, and Cells

Organisms from all three branches of life share a unique combination of characteristics. Biologists are scientists who use evidence to test hypotheses about life.

**For more details, study the Pull It Together feature at the end of the chapter.**

## 1.1 What Is Life?

Biology is the scientific study of life. The second half of this chapter explores the meaning of the term *scientific*, but first we will consider the question “What is life?” We all have an intuitive sense of what life is. If we see a rabbit on a rock, we know that the rabbit is alive and the rock is not. But it is difficult to state just what makes the rabbit alive. Likewise, in the instant after an individual dies, we may wonder what invisible essence has transformed the living into the dead.

One way to define life is to list its basic components. The **cell** is the basic unit of life; every **organism**, or living individual, consists of one or more cells. Every cell has an outer membrane that separates it from its surroundings. This membrane encloses the water and other chemicals that carry out the cell’s functions. One of those biochemicals, deoxyribonucleic acid (DNA), is the informational molecule of life (**figure 1.1**). Cells use genetic instructions—as encoded in DNA—to produce proteins, which enable cells to carry out their functions in tissues, organs, and organ systems.

A list of life’s biochemicals, however, provides an unsatisfying definition of life. After all, placing DNA, water, proteins, and a membrane in a test tube does not create life. And a crushed insect still contains all of the biochemicals that it had immediately before it died.

In the absence of a concise definition, scientists have settled on five qualities that, in combination, constitute life. **Table 1.1** summarizes them, and the rest of section 1.1 describes each one in more detail. An organism is a collection of structures that function together and exhibit all of these qualities. Note, however, that each trait in table 1.1 may also occur in nonliving objects. A rock crystal is highly organized, but it is not alive. A fork placed in a pot of boiling water absorbs heat energy and passes it to the hand that grabs it, but this does not make the fork alive. A fire can “reproduce” and grow, but it lacks most of the other characteristics of life. It is the *combination* of these five characteristics that makes life unique.

### A. Life Is Organized

Just as the city where you live belongs to a county, state, and nation, living matter also consists of parts organized in a hierarchical pattern (**figure 1.2**). At the smallest scale, all living structures are composed of particles called **atoms**, which bond together to form **molecules**. These molecules can form **organelles**, which

**Figure 1.1 Informational Molecule of Life.** All cells contain DNA, a series of “recipes” for proteins that each cell can make.  
Scott Camazine/123RF

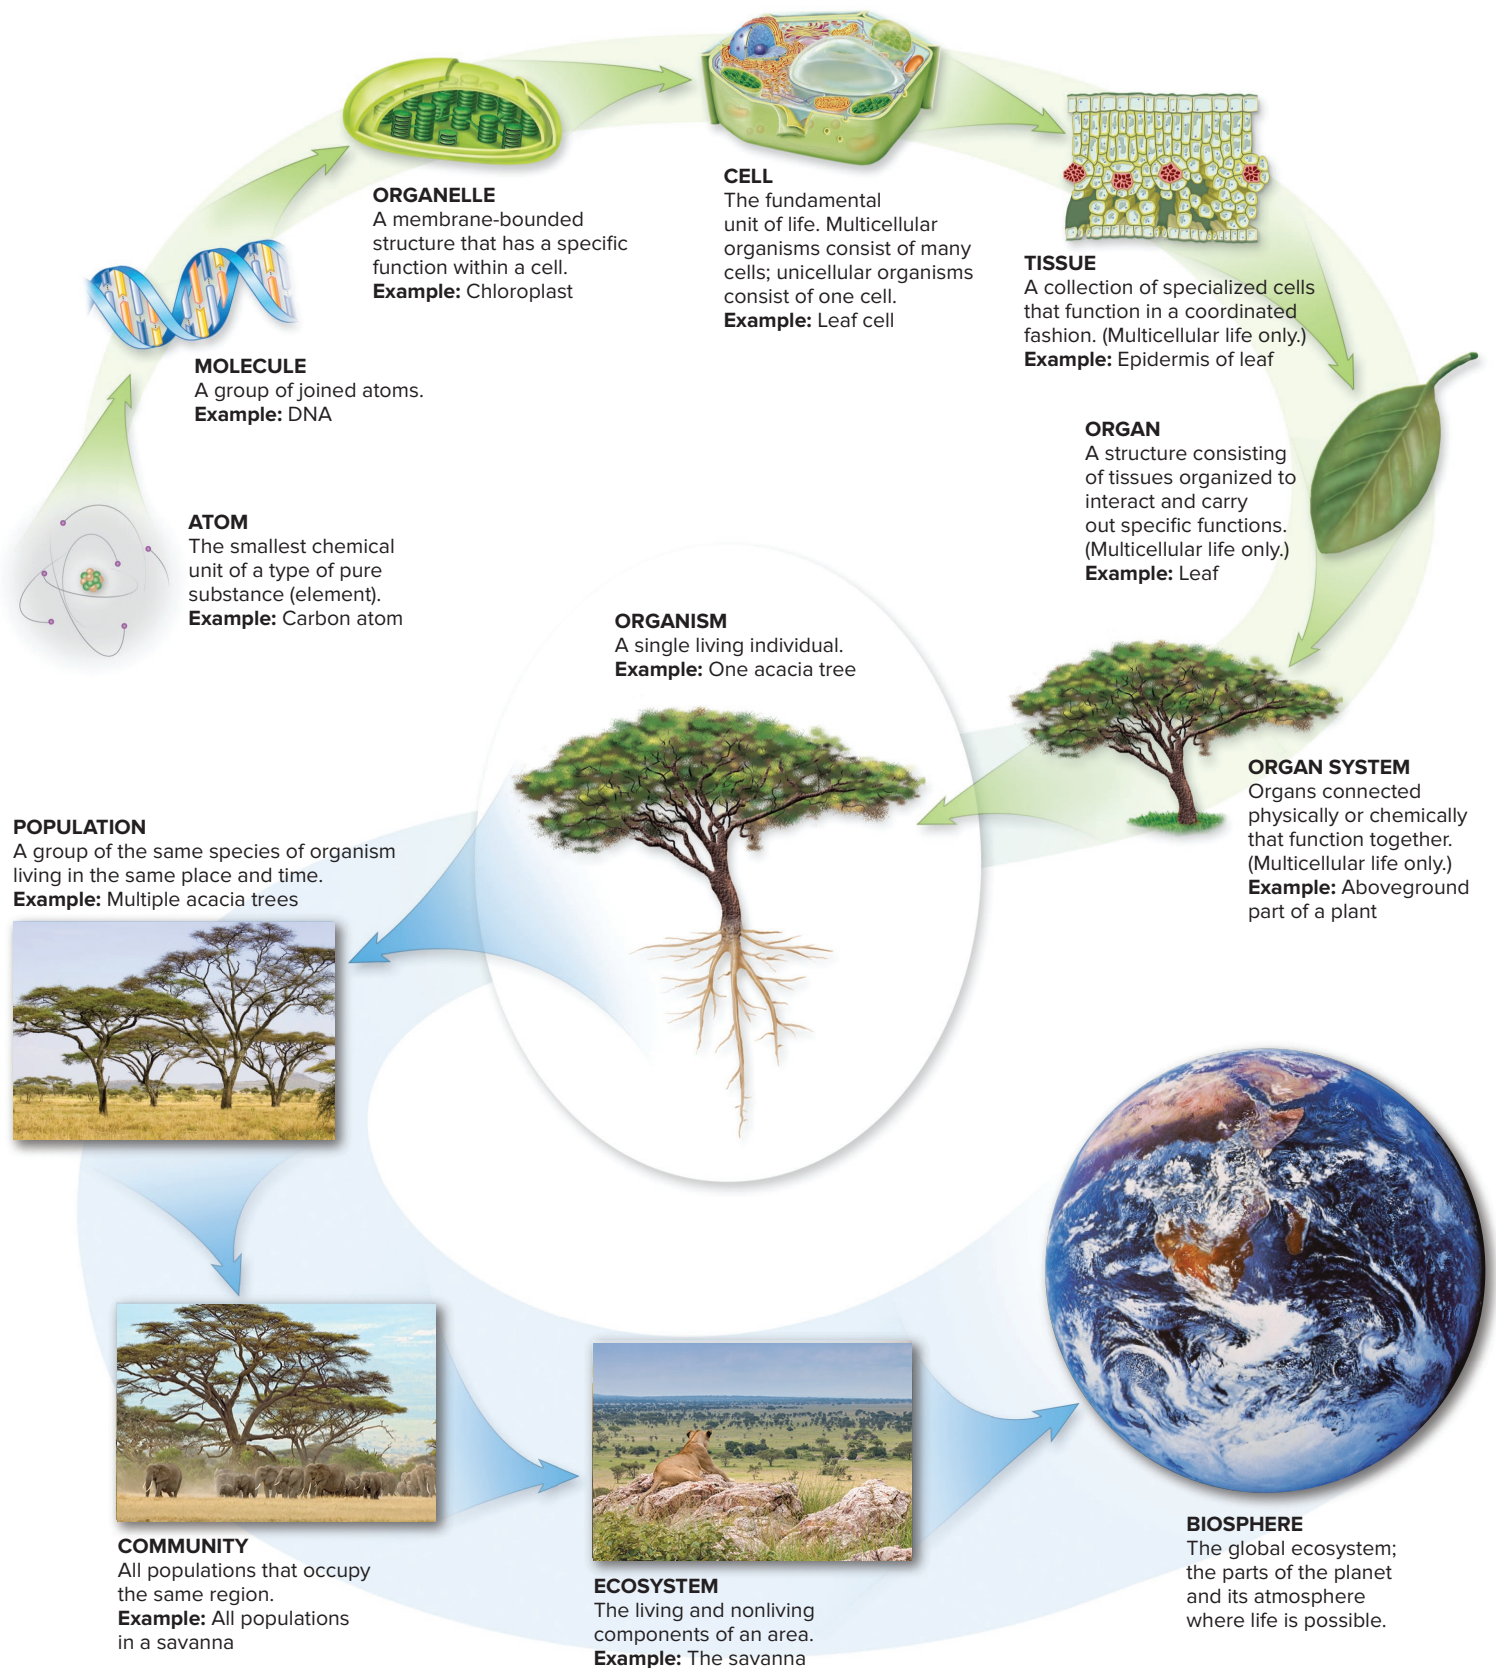

are compartments that carry out specialized functions in cells (note that not all cells contain organelles). Many organisms consist of single cells. In multicellular organisms such as the tree illustrated in figure 1.2, however, the cells are organized into specialized **tissues** that make up **organs**. Multiple organs are linked into an individual’s **organ systems**.

We have now reached the level of the organism, which may consist of just one cell or of many cells organized into tissues, organs, and organ systems. Organization in the living world extends beyond the level of the individual organism as well. A **population** includes members of the same species occupying the same place at the same time. A **community** includes the populations of different species in a region, and an **ecosystem** includes both the living and nonliving components of an area. Finally, the **biosphere** consists of all parts of the planet that can support life.

Biological organization is apparent in all life. Humans, eels, and evergreens, although outwardly very different, are all organized into specialized cells, tissues, organs, and organ systems. Single-celled bacteria, although less complex than animals or plants, still

**TABLE 1.1 Characteristics of Life: A Summary**

Characteristic	Example
Organization	Atoms make up molecules, which make up cells, which make up tissues, and so on.
Energy use	A kitten uses the energy from its mother’s milk to fuel its own growth.
Maintenance of internal constancy (homeostasis)	Your kidneys regulate your body’s water balance by adjusting the concentration of your urine.
Reproduction, growth, and development	An acorn germinates, develops into an oak seedling that increases in size, and, at maturity, reproduces sexually to produce its own acorns.
Evolution	Increasing numbers of bacteria survive treatment with antibiotic drugs.

**Figure 1.2 Life's Organizational Hierarchy.** This diagram applies life's organizational hierarchy to a multicellular organism (an acacia tree). Green arrows represent the organizational hierarchy up to the level of the organism; blue arrows represent levels that include multiple organisms.

**Figure 1.3 An Emergent Property—from Cells to Memories.** Highly branched cells interact to form a complex network in the brain. Memories, consciousness, and other qualities of the mind emerge only when these cells interact in a certain way.

contain DNA, proteins, and other molecules that interact in highly organized ways.

An organism, however, is more than a collection of successively smaller parts. **Emergent properties** are new functions that arise from physical and chemical interactions among a system's components, much as flour, sugar, butter, and chocolate can become brownies—something not evident from the parts themselves. **Figure 1.3** shows another example of emergent properties: the thoughts and memories produced by interactions among the neurons in a person's brain. For an emergent property, the whole is greater than the sum of the parts.

Emergent properties explain why structural organization is closely tied to function. Disrupt a structure, and its function ceases. Brain damage, for instance, disturbs the interactions between brain cells and can interfere with memory, coordination, and other brain functions. Likewise, if a function is interrupted, the corresponding structure eventually breaks down, much as unused muscles begin to waste away. Biological function and form are interdependent.

## B. Life Requires Energy

Inside each cell, countless chemical reactions sustain life. These reactions, collectively called metabolism, allow organisms to acquire and use energy and nutrients to build new structures, repair old ones, and reproduce.

Biologists divide organisms into broad categories based on their source of energy and raw materials (**figure 1.4**). **Primary producers**, also called autotrophs, make their own food by

extracting energy and nutrients from nonliving sources. The most familiar primary producers are the plants and microbes that capture light energy from the sun, but some bacteria can derive chemical energy from rocks. **Consumers**, in contrast, obtain energy and nutrients by eating other organisms, living or dead; consumers are also called heterotrophs. You are a consumer, relying on energy and atoms from food to stay alive. **Decomposers** are heterotrophs that absorb energy and nutrients from wastes or dead organisms. These organisms, which include fungi and some bacteria, recycle nutrients to the nonliving environment.

Within an ecosystem, organisms are linked into elaborate food webs, beginning with primary producers and continuing through several levels of consumers (including decomposers). But energy transfers are never 100% efficient; some energy is always lost to the surroundings in the form of heat (see **figure 1.4**). Because no organism can use it as an energy source, heat represents a permanent loss from the cycle of life. All ecosystems therefore depend on a continuous stream of energy from an outside source, usually the sun. **i** *food webs*, section 38.3A

## C. Life Maintains Internal Constancy

The conditions inside cells must remain within a constant range, even if the surrounding environment changes. For example, a cell must maintain a certain temperature; it will die if it becomes too

**Figure 1.4 Life Is Connected.** All organisms extract energy and nutrients from the nonliving environment or from other organisms. Decomposers recycle nutrients back to the nonliving environment. At every stage along the way, heat is lost to the surroundings.

**Figure 1.5 Temperature Homeostasis.** (a) Shivering and (b) sweating are responses that maintain body temperature within an optimal range. (a): Kristy-Anne Glubish/Design Pics; (b): John Rowley/Getty Images

hot or too cold. The cell must also take in nutrients, excrete wastes, and regulate its many chemical reactions to prevent a shortage or surplus of essential substances. **Homeostasis** is this state of internal constancy.

Because cells maintain homeostasis by counteracting changes as they occur, organisms must be able to sense and react to stimuli. To illustrate this idea, consider the mechanisms that help maintain your internal temperature at about 37°C (figure 1.5). When you go outside on a cold day, you may begin to shiver; heat from these muscle movements warms the body. In severe cold, your lips and fingertips may turn blue as your circulatory system sends blood away from your body’s surface. Conversely, on a hot day, sweat evaporating from your skin helps cool your body.

## D. Life Reproduces, Grows, and Develops

Organisms reproduce, making other individuals that are similar to themselves (figure 1.6). Reproduction transmits DNA from generation to generation; this genetic information defines the inherited characteristics of the offspring.

Reproduction occurs in two basic ways: asexually and sexually. In **asexual reproduction**, genetic information comes from only one parent, and all offspring are virtually identical (figure 1.6a). One-celled organisms such as bacteria reproduce asexually by doubling and then dividing the contents of the cell. Many multicellular organisms also reproduce asexually. A strawberry plant, for instance, produces “runners” that sprout leaves and roots, forming new plants that are identical to the parent. Fungi produce countless asexual spores, visible as the green, white, or black powder on moldy bread or cheese. Some animals, including sponges, reproduce asexually when a fragment of the parent animal detaches and develops into a new individual.

In **sexual reproduction**, genetic material from two parents unites to form an offspring, which has a new combination of inherited traits (figure 1.6b). By mixing genes at each generation, sexual reproduction results in tremendous diversity in a population. Genetic diversity, in turn, enhances the chance that some individuals will survive even if conditions change. Sexual reproduction is therefore a very successful strategy, especially in an

**Figure 1.6 Asexual and Sexual Reproduction.** (a) Identical plantlets develop along the runners of a wild strawberry plant. (b) Two swans protect their offspring, the products of sexual reproduction. (a): Dorling Kindersley/Getty Images; (b): jadranko/Moment/Getty Images

environment where conditions change frequently; it is extremely common among plants, animals, and fungi.

Before each offspring can reproduce, it must develop into an adult. The term *development* describes not only growth but also the many other changes that occur as an organism matures. Each young swan in figure 1.6b, for example, started as a single fertilized egg cell. That cell divided over and over, forming an embryo. Continued cell division and specialization into tissues, organs, and organ systems yielded the newly hatched swans. The youngsters will continue to grow as they develop into adults that can also reproduce—just like their parents.

## E. Life Evolves

One of the most intriguing questions in biology is how organisms become so well suited to their environments. A beaver’s enormous front teeth, which never stop growing, are ideal for gnawing wood. Tubular flowers have exactly the right shapes for the beaks of their hummingbird pollinators. Some organisms have color patterns that enable them to fade into the background (figure 1.7).

These examples, and countless others, illustrate adaptations. An **adaptation** is an inherited characteristic or behavior that enables an organism to survive and reproduce successfully in its environment.

**Figure 1.7 Hiding in Plain Sight.** This pygmy seahorse is barely visible in its coral habitat, thanks to its unique body shape, skin color, and texture. Mark Webster/Getty Images

Where do these adaptive traits come from? The answer lies in natural selection. The simplest way to think of natural selection is to consider two facts. First, populations produce many more offspring than will survive to reproduce; these organisms must compete for limited resources such as food and habitat. A single mature oak tree may produce thousands of acorns in one season, but only a few are likely to germinate, develop, and reproduce. The rest die. Second, no organism is exactly the same as any other. Genetic mutations—changes in an organism’s DNA sequence—generate variability in all organisms, even those that reproduce asexually.

Of all the offspring in a population, which will outcompete the others and live long enough to reproduce? The answer is those with the best adaptations to the current environment; conversely, the poorest competitors are most likely to die before reproducing. A good definition of **natural selection**, then, is the enhanced reproductive success of certain individuals from a population based on inherited characteristics.

**Figure 1.8** shows one example of natural selection. The illustration shows a population of bacteria in which a mutation has occurred in one cell. If antibiotics are present, the drug kills most of the unmutated cells. The mutated cell, however, is unaffected and can reproduce. After many generations of exposure to the drug, antibiotic-resistant cells are common.

The same principle applies to all populations. In general, individuals with the best combinations of genes survive and reproduce, while those with less suitable characteristics fail to do so. Over many generations, individuals with adaptive traits make up most or all of the population.

But the environment is constantly changing. Continents shift, sea levels rise and fall, climates warm and cool. What happens to a population when the selective forces that drive natural selection change? Only some organisms survive: those with the “best” traits in the *new* environment. Features that may once have been rare become more common as the reproductive success of individuals with those traits improves. Notice, however, that this outcome depends on variability within the population. If no individual can reproduce in the new environment, the species may go extinct.

Natural selection is one mechanism of **evolution**, which is a change in the genetic makeup of a population over multiple

generations. Although evolution can also occur in other ways, natural selection is the mechanism that selects for adaptations. Charles Darwin became famous in the 1860s after the publication of his book *On the Origin of Species by Means of Natural Selection*, which introduced the theory of evolution by natural selection; another naturalist, Alfred Russel Wallace, independently developed the same idea at around the same time.

Evolution is the single most powerful idea in biology. As unit 3 describes in detail, evolution has been operating since life began, and it explains the current diversity of life. In fact, the similarities among existing organisms strongly suggest that all species descend from a common ancestor. Evolution has molded the life that has populated the planet since the first cells formed almost 4 billion years ago, and it continues to act today.

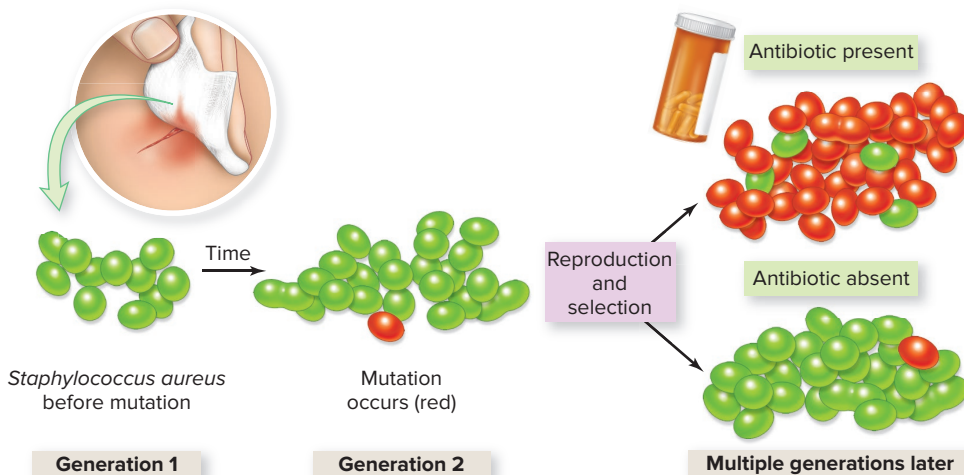

### 1.1 MASTERING CONCEPTS

1. Does any nonliving object possess all of the characteristics of life? Explain your answer.
2. List the levels of life’s organizational hierarchy from smallest to largest, starting with atoms and ending with the biosphere.
3. The bacteria in figure 1.8 reproduce asexually, yet they are evolving. What is their source of genetic variation?

## 1.2 The Tree of Life Includes Three Main Branches

Biologists have been studying life for centuries, documenting the existence of everything from bacteria to blue whales. An enduring problem has been how to organize the ever-growing list of known organisms into meaningful categories. **Taxonomy** is the science of naming and classifying organisms.

The basic unit of classification is the **species**, which designates a distinctive “type” of organism. Closely related species are grouped into the same **genus**. Together, the genus and a specific descriptor denote the unique, two-word scientific name of each

**Figure 1.8 Natural Selection.** *Staphylococcus aureus* (commonly called “staph”) is a bacterium that causes skin infections. A bacterium undergoes a random genetic mutation that (by chance) makes the cell resistant to an antibiotic. The presence of the antibiotic increases the reproductive success of the resistant cell and its offspring. After many generations, nearly all of the bacteria in the population are antibiotic resistant. Conversely, if antibiotics are absent, the antibiotic-resistance trait remains rare.

species. A human, for example, is *Homo sapiens*. (Note that scientific names are always italicized and that only the genus is capitalized.) Scientific names help taxonomists and other biologists communicate with one another.

But taxonomy involves more than simply naming species. Taxonomists also strive to classify organisms according to what we know about evolutionary relationships; that is, how recently one type of organism shared an ancestor with another type. The more recently they diverged from a shared ancestor, the more closely related we presume the two types of organisms to be. Researchers infer these relationships by comparing anatomical, behavioral, cellular, genetic, and biochemical characteristics.

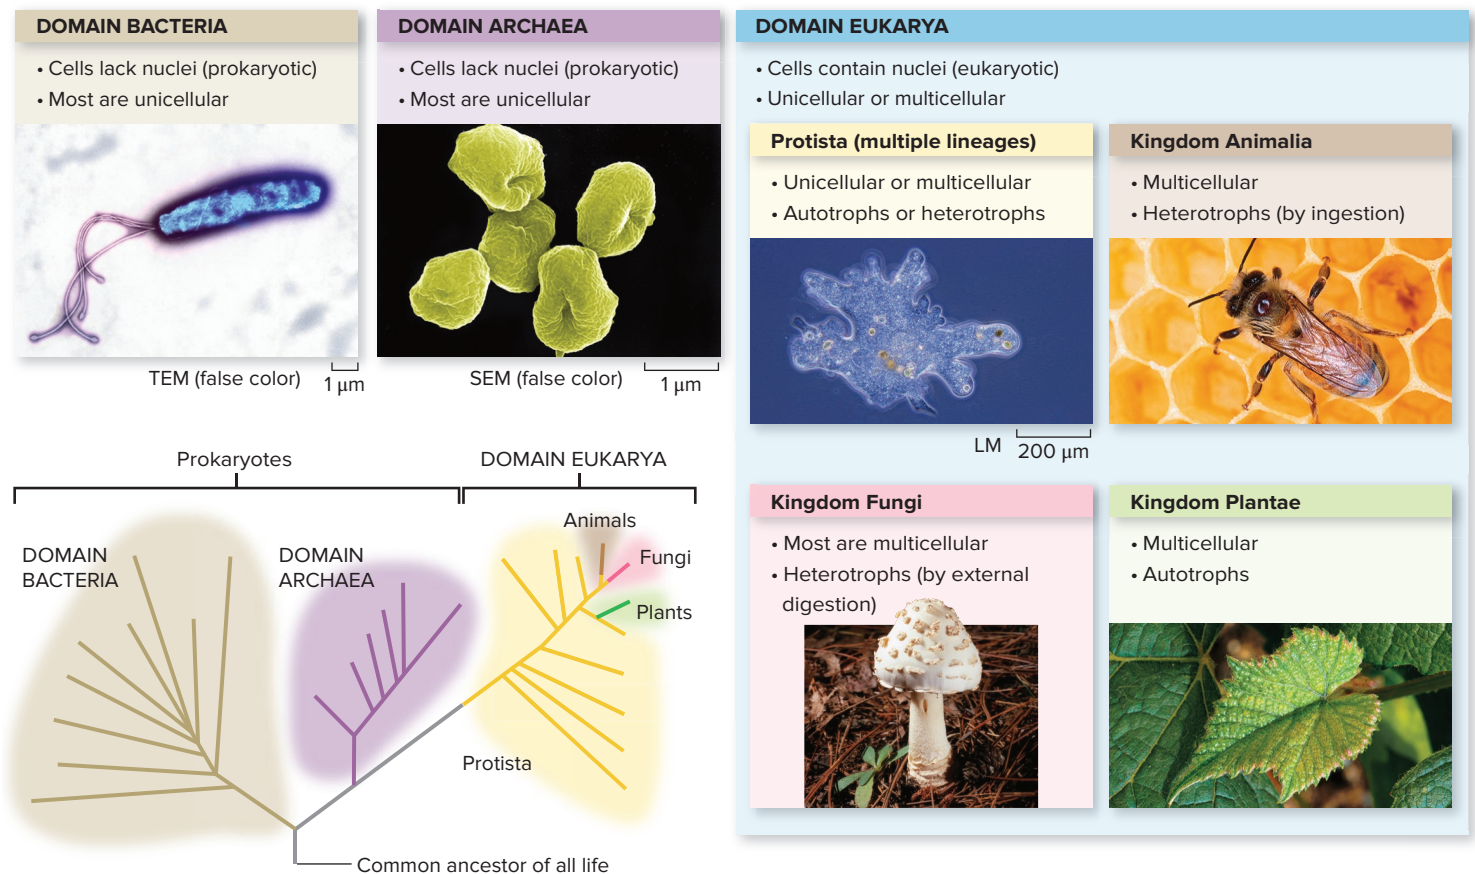

Section 14.6 describes the taxonomic hierarchy in more detail. For now, it is enough to know that genetic evidence suggests that all species fall into one of three **domains**, the broadest (most inclusive) taxonomic category. **Figure 1.9** depicts the three domains: Bacteria, Archaea, and Eukarya. The species in domains Bacteria and Archaea are superficially similar to one another; all are prokaryotes, meaning that their DNA is free in the cell and not confined to an organelle called a nucleus. Major differences in DNA sequences separate these two domains from each other. The third domain, Eukarya, contains all species of eukaryotes, which are unicellular or multicellular organisms whose cells contain a nucleus.

The species in each domain are further subdivided into **kingdoms**; figure 1.9 shows the kingdoms within domain Eukarya. Three of these kingdoms—Animalia, Fungi, and Plantae—are familiar to most people. Within each one, organisms share the same general strategy for acquiring energy. The plant kingdom contains autotrophs, whereas fungi and animals are consumers that differ in the details of how they obtain food. But the fourth group of eukaryotes, the Protista, contains a huge collection of unrelated species. Protista is a convenient but artificial “none of the above” category for the many species of eukaryotes that are not plants, fungi, or animals.

New research based on genetic sequences is helping to organize the eukaryotes into several “supergroups.” The aim is to place each species with its relatives, regardless of its historical classification as an animal, a fungus, a plant, or a protist. Section 18.5 describes the supergroups in more detail.

## 1.2 MASTERING CONCEPTS

1. What are the goals of taxonomy?
2. How are domains related to kingdoms?
3. List and describe the four main groups of eukaryotes. How is the organization of eukaryotes changing?

**Figure 1.9 Life's Diversity.** The three domains of life arose from a hypothetical common ancestor, shown at the base of the evolutionary tree.
